Re: Post-Occupancy Assessment Report
Indoor Air & Soil Gas Sampling
Area A: Sub-Parcel A11-1
Tradepoint Atlantic
Sparrows Point, MD 21219

Dear Ms. Brown:

On March 8, 2020, ARM Group LLC (ARM), on behalf of EnviroAnalytics Group, LLC (EAG), completed the heating season post-occupancy sampling event to evaluate conditions below and within the warehouse facility on Sub-Parcel A11-1 (the Site) of the Tradepoint Atlantic property located on Sparrows Point, Maryland. The post-occupancy assessment included the collection of sub-slab soil gas and indoor air samples to evaluate the potential for vapor intrusion, and to confirm the effectiveness of the vapor barrier and passive sub-slab venting system installed below the warehouse floor. This Post-Occupancy Assessment Report details the findings of the sub-slab soil gas and indoor air sampling event completed in March 2020 following building occupancy.

An initial Building Occupancy Assessment (BOA) was conducted at the warehouse facility prior to occupancy, and the findings were submitted to the Maryland Department of the Environment (MDE) and the United States Environmental Protection Agency (USEPA) within the BOA letter report dated October 18, 2019. The BOA was conducted in accordance with the Sub-Slab Soil Gas & Indoor Air Monitoring Plan dated September 13, 2019 (the Monitoring Plan). The Monitoring Plan was amended by comments received from the USEPA on October 8, 10, and 24, 2019, which are documented in email correspondence between EAG and the USEPA on February 12, 2020. The amendments are reflected in this post-occupancy assessment.

On October 9, 2019, during the initial BOA, leak tests were performed on the four permanent sub-slab soil gas sampling points that had been installed through the floor slab on October 8, 2019. Of the 12 venting pipe monitoring points (installed during the construction of the warehouse facility's passive sub-slab venting system), leak tests were performed on February 12, 2020 for the three

locations that were specified to be sampled by the USEPA. These leak tests are performed to ensure that valid soil gas samples are collected by providing quantitative proof of the integrity of the surface seal. The testing was initiated through the introduction of a gaseous tracer compound (helium) into a shroud which covered the sampling point. While the shroud was inflated, air was purged from the monitoring point using a three-way valve and a syringe. Using the same three-way valve and syringe, a Tedlar bag was then filled with air that was withdrawn from the monitoring point. The air inside of the Tedlar bag was then screened in the field with a hand-held helium meter.

As stated in Field Standard Operating Procedure (SOP) Number 002, if less than 10% of the starting concentration of the tracer gas within the shroud was observed in the Tedlar bag sample, the seal could be considered competent and sampling would continue. During fieldwork, the concentration of helium measured in the Tedlar bag was always less than 10%, and each seal was deemed adequate to proceed.

As documented in the email correspondence between EAG and the USEPA on February 12, 2020, 10 samples were specified to be collected during this initial round of post-occupancy sampling: five sub-slab soil gas samples (two permanent locations and three venting pipe monitoring locations) and five indoor air samples. Sampling at the specified locations was conducted on March 8, 2020. **Figure 1** shows the locations of the completed sub-slab soil gas and indoor air samples. One background sample of outdoor ambient air was also collected for comparison to the indoor air data, the location of which is also shown on **Figure 1**.

All sampling was completed according to the procedures outlined in the Indoor Air Sampling SOP Number 001 and Sub-Slab Soil Gas Sampling SOP Number 002. Prior to sampling sub-slab soil gas, a syringe was attached to the three-way valve installed at each monitoring point, and approximately 180cc of air were purged. After the tubing and probe had been purged of any ambient air, an evacuated stainless-steel Summa canister with a flow restrictor set for an 8-hour intake time was attached to the tubing. The soil gas sample was then collected over a period of 8 hours. Similarly, the indoor air samples (and the outdoor ambient air sample) were collected in a stainless-steel Summa canister over an 8-hour period at a height of 3 to 6 feet above the floor (in the breathing zone). At the completion of the sampling period, the valves of the Summa canisters were closed, and an identification tag was attached to each canister.

Quality assurance and quality control (QA/QC) samples were collected during this study to evaluate field/laboratory variability. As specified in the Monitoring Plan, a blind field duplicate (selected at A11-016-SG) and an equipment blank consisting of “clean” air provided by the laboratory were collected in the field and submitted for analysis. One field blank (outdoor ambient air sample) was taken from the exterior of the warehouse facility in the breathing zone and is indicated on **Figure 1**.

ARM submitted the five sub-slab soil gas samples, five indoor air samples, and QA/QC samples to Pace Analytical Services, Inc. (PACE), via courier and under a completed Chain of Custody, to be analyzed for Volatile Organic Compounds (VOCs) via USEPA Method TO-15. The analytical results were received from PACE on March 18, 2020. The laboratory's Certificate of Analysis is included as **Attachment 1**.

The detected VOC parameters within the soil gas samples are summarized and compared to the Project Action Limits (PALs) in **Table 1**. The PALs, which were established in the property-wide Quality Assurance Project Plan (QAPP), are generally based on the MDE Commercial Tier 1 Target Soil Gas Screening Levels. The table also shows the MDE's updated Commercial Tier 1 Target Soil Gas Screening Levels which were published in May 2019. The detected VOC parameters within the indoor air samples are summarized and compared to the MDE's May 2019 Commercial Indoor Air Screening Levels in **Table 2**. The outdoor air sample results are also presented on this table. The outdoor air sample generally had lower concentrations than the indoor air samples, as expected when compared to the enclosed space of the warehouse. The summary tables include all parameters with at least one detection among the samples, and the complete analytical results can be viewed in the provided laboratory report (**Attachment 1**).

While there were several VOCs detected at low concentrations in the samples, none of the detected concentrations exceeded the applicable PALs or the MDE's updated Commercial Tier 1 Target Soil Gas Screening Levels in any of the samples submitted for analysis. It has been determined that there is no significant risk to commercial workers via the vapor intrusion to indoor air risk pathway, the vapor barrier and passive sub-slab venting system appear to be functioning as designed, and the structure is suitable for continued occupancy. As required by the USEPA, another round of post-occupancy sub-slab soil gas and indoor air sampling will be conducted during the cooling season utilizing the same sample locations.

Dear Mr. Calenda:

Enclosed are the analytical results for sample(s) received by the laboratory on March 11, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

This project follows the April 5, 2016 revision 3 Quality Assurance Project Plan for Sparrows Point Terminal Site, Sparrows Point, MD prepared for EnviroAnalytics Group and is not for PA DEP compliance reporting.

If you have any questions concerning this report, please feel free to contact me.

PROJECT NARRATIVE

Project: A11 Soil Gas Q1 2020

Pace Project No.: 30354073

Method: TO-15

Description: TO15 MSV AIR

Client: EnviroAnalytics Group, LLC

Date: March 18, 2020

General Information:

13 samples were analyzed for TO-15. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

QC Batch: 665320

SS: This analyte did not meet the secondary source verification criteria for the initial calibration. The reported result should be considered an estimated value.

- LCS (Lab ID: 3568219)
- 1,2,4-Trichlorobenzene

Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

Additional Comments:

Analyte Comments:

QC Batch: 665320

N2: The lab does not hold NELAC/TNI accreditation for this parameter but other accreditations/certifications may apply. A complete list of accreditations/certifications is available upon request.

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,

without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: A11 Soil Gas Q1 2020

Pace Project No.: 30354073

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.
