1.0 Introduction

This report presents January – June 2013 semi-annual groundwater monitoring results for the Coke Point and Greys Landfills at the Sparrows Point facility. Groundwater data and analysis is included that is meant to fulfill the applicable ongoing groundwater compliance monitoring requirements for the landfills as outlined in the Coke Point and Greys Landfill Sampling Plan letter received from the Maryland Department of the Environment (MDE) on December 3, 2012.

The following data collection activities occurred during the first half of 2013:

- water level measurements in groundwater monitoring wells;
- sampling of groundwater monitoring wells; and
- laboratory analysis of monitoring well samples.

Results of the above investigations are described and presented in this report. This report:

- Provides field data sheets and laboratory reports documenting groundwater sample collection;
- Presents the water level data collected;
- Provides laboratory reports for sample analyses;
- Tabulates laboratory analytical data in time-series format;
- Discusses the water quality results;
- Includes location maps for the landfills with monitoring well locations posted;
- Includes groundwater contour maps for the shallow zone and intermediate groundwater zones at the landfills; and
- Includes other figures developed to present the monitoring information.

2.0 Site Description

Coke Point Landfill occupies land on the southern edge of the Sparrows Point property (Figure 1). Coke Point Landfill was used for disposal of non-hazardous industrial waste generated on-site during steel production. Recent activities include recycling efforts to recover iron bearing materials from the landfill.

Greys Landfill occupies approximately 40 acres on the north side of the Sparrows Point property located in southeastern Baltimore County, between I-695 and the Peninsula Expressway (Figure 1). Greys Landfill has been used for the disposal of industrial waste generated on-site during steel production and is currently being utilized for ongoing non-hazardous waste disposal associated with the continuing operation of the wastewater treatment facility and demolition activities.

Monitoring well location maps are included for Coke Point and Greys Landfills (Figures 2 and 3 respectively). The maps have been annotated to show the surveyed locations of groundwater monitoring wells installed to provide monitoring data for the landfills.

Groundwater at the landfill sites is monitored via a series of monitoring wells, which are mostly completed in clusters, with one shallow well and one or more intermediate wells. The shallow wells are completed with well screens situated to monitor the unconfined shallow groundwater zone. These are considered water table wells. Well screens in the shallow monitoring wells typically straddle elevation 0. The intermediate wells are completed with well screens in native sand layers at screen top elevations ranging from roughly -10 to -60 feet in depth. Among the intermediate wells, the deeper screens are generally located near the southern edge of Coke Point Landfill. Between the shallow and the intermediate well screens there are generally one or more layers of low permeability materials that restrict groundwater communication vertically.

3.0 Groundwater Monitoring Procedures

3.1 Coke Point Landfill

Nineteen wells were sampled in March 2013 at Coke Point Landfill for the 1st half 2013 semi-annual monitoring effort. A summary of the monitor well construction details is presented in Table 1.

The monitoring parameters for the site were specified in the December 3, 2012 MDE letter and included Table I (Volatile Organic Compounds) and Table II (Elements and Indicator Parameters). In addition, five groundwater monitoring wells were selected for sampling and analysis of Semi-Volatile Organic Compounds. The wells were selected based on notable detections of semi-volatile organic compounds from review of historical data at the landfill.

Data summary tables presenting the monitoring well groundwater sampling results in time-series format are presented in Appendix A (Table I Volatile Organic Compounds), Appendix B (Table II Elements and Indicator Parameters), and Appendix C (Semi-Volatile Organic Compounds). To ease visual review of the tables, the data are separated so that time series results for an individual well are contained on the same table. Analyses were performed by Pace Laboratories, Inc. using EPA methods.

3.2 Greys Landfill

Thirty wells were sampled in March 2013 at Greys Landfill for the 1st half 2013 semi-annual monitoring effort. A summary of the monitor well construction details is presented in Table 2.

The monitoring parameters for the site were specified in the December 3, 2012 MDE letter and included Table I (Volatile Organic Compounds) and Table II (Elements and Indicator Parameters). In addition, six groundwater monitoring wells were selected for sampling and analysis of Semi-Volatile Organic Compounds. The wells were selected based on notable detections of semi-volatile organic compounds from review of historical data at the landfill.

Data summary tables are presenting the monitoring well groundwater sampling results in time-series format are presented in Appendix D (Table I Volatile Organic Compounds), Appendix E (Table II Elements and Indicator Parameters), and Appendix F (Semi-Volatile Organic Compounds). To ease visual review of the tables, the data are separated so that time series results for an individual well are contained on the same table. Analyses were performed by Pace Laboratories, Inc. using EPA methods.

3.3 Groundwater Sampling Procedures

Groundwater levels were measured and recorded prior to sampling a monitoring well. Water levels were measured with an electronic tape to the nearest 0.01-foot. Water levels were referenced to the top of the surveying inner casing of the wells. Data for groundwater levels as collected in the 1st half of 2013 is tabulated and compared to previous data in Table 3 for Coke Point Landfill and Table 4 for Greys Landfill.

Groundwater samples were collected using a low-flow technique. CSI Environmental, LLC (CSI) personnel utilized a peristaltic pump with dedicated disposable tubing to purge the monitoring wells at a reported purge rate of 150 milliliters per minute. Purging continued until field water quality parameters pH, temperature, dissolved oxygen, specific conductance, salinity, total dissolved solids (TDS), and oxidation-reduction potential (ORP) were stable. Field water quality parameters were monitored in the field by directing the pump discharge into a flow-through cell. A measurement for each field water quality parameter was recorded at a frequency of once every five minutes. After three consecutive measurements indicated stability (defined as variance of less than ten percent for all parameters) the sample was collected. Field data sheets documenting the sample collection are presented in Appendix G.

Samples were collected in laboratory-provided bottle ware and labeled. Care was taken to control flow rates so as to not over-top pre-preserved bottles. A chain of custody form was completed indicating sample number, date, time, and the analyses required. Samples were stored on ice in a cooler until shipped to PACE Analytical Services, Inc. for analysis. Laboratory Certificates of Analysis and Chain of Custody forms are provided in Appendix H.

4.0 Groundwater Data Evaluation

Depth to water measurements and groundwater monitoring well survey data were used to calculate groundwater elevations and develop groundwater contour maps for the landfills. One groundwater contour map was developed for the shallow groundwater zone and a second map was developed for the intermediate groundwater zone.

Analytical data from samples have been tabulated and evaluated with respect to detections of organic and inorganic compounds. An interpretive discussion of the findings is provided in the following sections.

4.1 Coke Point Landfill

4.1.1 Groundwater Elevations and Contours

Groundwater elevations for the Coke Point Landfill monitoring wells collected during the first half of 2013 assessment event are presented in Table 3. These data are shown on groundwater contour maps for the shallow groundwater zone (Figure 4) and the intermediate groundwater zone (Figure 5). Vertical survey data are referenced to the NAVD 1988 datum.

Groundwater elevations associated with the shallow wells are shown on Figure 4. In general, the groundwater elevations are flat with no apparent flow gradient. The elevations ranged between 0.09 to 0.77 feet with differences less than 1 foot between all the shallow wells. Flow directions could not be readily defined based on the elevation data.

Groundwater elevations for the intermediate wells are presented on Figure 5. Groundwater elevations for the intermediate wells are between 0.10 to 1.63 feet, revealing a very flat gradient in this groundwater zone. With the very flat gradient, groundwater flow directions are not readily discernible in the intermediate groundwater zone beneath the landfill.

Groundwater elevations in the shallow wells in each cluster were relatively similar to the groundwater elevations in the corresponding intermediate well (Table 3). These elevations indicate limited potential for downward migration of groundwater from the shallow wells towards the intermediate wells.

4.1.2 Groundwater Quality Evaluation

Volatile Organic Compounds

Volatile organic compound (VOCs) results for Coke Point Landfill are presented in Appendix A and posted on maps for shallow (Figure 6) and intermediate (Figure 7) wells to facilitate the review of impact to groundwater in these zones. Data posted on Figures 6 and

7 include only the maximum concentration of any individual VOC compound for the 1st half 2013 period.

VOC results are shown for the shallow groundwater monitoring wells at Coke Point Landfill in Figure 6. Benzene and acetone were the most commonly identified volatile compound. The highest VOC concentration detected in the shallow zone monitoring wells was 23,900 ug/L benzene at well CP08-PZM008. Historical data indicates that benzene values for this monitoring well have ranged between 15,000 ug/L to 23,900 ug/L. Other benzene values were much lower, ranging between 16.5 ug/L to 547 ug/L.

For the shallow zone, review of Figure 6 shows that the most impacted well (CP08-PZM008) is located on the east side of the landfill approximately 1200 feet from the closest shoreline located to the south of the monitoring well. Groundwater in this area has a flat gradient but can be interpreted to be flowing to the south towards the shoreline. The two monitoring wells south of CP08-PZM008 have notably lower VOC concentrations providing evidence that the VOC impact is attenuated with distance from CP08-PZM008.

VOC results are shown for the intermediate groundwater monitoring wells at Coke Point Landfill in Figure 7. The highest VOC concentration detected in the intermediate zone monitoring wells was 229 ug/L benzene at well CP16-PZM035. Historical data indicates that benzene values for this monitoring well have ranged between 229 ug/L to 290 ug/L.

VOC groundwater concentrations are lower in the intermediate zone than in the shallow zone, with the highest individual VOC concentration in March 2013 being 229 ug/L benzene in CP16-PZM035. All other intermediate monitoring wells have maximum VOC concentrations less than 38 ug/L. VOC impact to the intermediate wells is relatively muted.

SVOCs

Semi volatile organic compounds (SVOCs) results for Coke Point Landfill are presented in Appendix B. SVOCs compounds are not listed as part of the Table I and Table II requirements outlined in the December 3, 2012 letter; however a subset of the groundwater monitoring wells was sampled based on recommendations from a previous groundwater compliance report for Coke Point Landfill published in 2011.

Five groundwater monitoring wells had samples collected and analyzed for SVOCs during the March 2013 sampling event. The wells sampled for SVOCs include CP05-PZM008, CP07-PZM006, CP08-PZM008 and CP15-PZM020 located in the shallow zone and well CP16-PZM035 located in the intermediate zone. SVOC results for the Coke Point Landfill are posted on the maps for shallow (Figure 6) and intermediate (Figure 7) wells to facilitate the review of impact to groundwater in these zones.

SVOCs were detected in the five groundwater monitoring wells. In general, the wells with SVOC detections are also wells with VOC detections. Water table wells generally have higher SVOC concentrations than intermediate wells. The highest SVOC concentration detected among the five wells that were sampled was 273 ug/L naphthalene at well CP08-

PZM008, which is located in the shallow zone. Historical data indicates that naphthalene values for this monitoring well have ranged between 190 ug/L to 450 ug/L.

Inorganics

Inorganic compound data for Coke Point Landfill are presented in Appendix C. Individual results for arsenic, chromium and lead are posted on maps for shallow (Figure 8) and intermediate (Figure 9) groundwater monitoring wells to facilitate the review of impact to groundwater in these zones. These metals were selected as representative analytes that provide notable indications of impacts to groundwater either from former site activities or baseline conditions at the site.

Review of the data tables in Appendix C reveals that detections of individual metals are sporadic at the landfill location, indicated limited inorganic compounds impacts to groundwater from the site activities. Review of the representative metal data shown in Figure 8 for the shallow groundwater zone indicates that all three indicator metals were below detection limits in six monitoring wells; two wells had one detection; one well had two detections and one well had detections for all three indicator metals. The monitoring well with detections for all three indicator metals was CP15-PZM020. The highest concentration for all three indicator metals was 0.031 mg/L of Lead at CP09-PZM010. Historical data indicates that lead values for this monitoring well have ranged between 0.007 mg/L to 0.074 mg/L.

Representative metal compounds were not detected in the intermediate groundwater wells at Coke Point Landfill (Figure 9). These results confirm limited impacts to intermediate groundwater from site activities and correspond with the lack of vertical groundwater gradient for this area documented from groundwater elevation data.

4.2. Greys Landfill

4.2.1 Groundwater Elevations and Contours

Groundwater elevations for the Greys Landfill monitoring wells collected during the first half of 2013 assessment event are presented in Table 4. These data were developed into a groundwater contour map for the shallow groundwater zone (Figure 10) and the intermediate groundwater zone (Figure 11). Vertical survey data are referenced to the NAVD 1988 datum.

Figure 10 shows representative groundwater levels and groundwater contours for the shallow zone monitoring wells. In general, a water table mound is present beneath the landfill, and groundwater in the shallow zone flows radially from the landfill. Groundwater from beneath the northern and western sides of the landfill appears to largely flow towards Bear Creek to the northwest of the landfill. Shallow groundwater from beneath the southeasterly side of the landfill appears to flow to the southeast; the discharge area for this southeasterly-flowing groundwater is not certain, although it could discharge into manmade drainage ditches or possibly be part of groundwater flow controlled by adjacent surface water drainage features.

Groundwater elevations for the intermediate wells are presented on Figure 11. Groundwater elevations for all but four of the fourteen intermediate wells are between -0.71 to 0.79 feet, revealing a very flat gradient in this groundwater zone. A flow trend towards Bear Creek may be present; however, with the flat gradient, groundwater flow directions are not readily discernible in the intermediate groundwater zone beneath the landfill.

Groundwater elevations in intermediate wells GL-03(-16), GL-09(-20), GL-11(-33), and GL-12 (-17) did not fall in the range of -0.71 to 0.79 feet. The groundwater elevations in GL-03(-16) have been consistent, at 3.40 to 4.41 feet from the July 2009 monitoring event to this event. GL-09(-20) and GL-11(-33) have varied over time, water level elevations in the first half of 2013 were 6.25 and 3.12 respectively. The reason for the differing water levels in these three wells is not clear. The intermediate groundwater elevations in well GL-12 (-17) was recorded at -3.39 feet in elevation in the March 2013 event. This result appears to be a field measurement anomaly and will be reviewed further in future monitoring events.

Groundwater elevations in the shallow wells in each cluster are higher than the groundwater elevations in the corresponding intermediate well. (Table 4). This indicates that the potential exists for water table mounding and downward migration of groundwater from the shallow wells towards the intermediate wells. This data also indicates that the intervening (lower permeability) geologic materials between the shallow and intermediate wells screens resist groundwater flow, leading to the measureable difference in groundwater elevations.

4.2.2 Groundwater Quality Evaluation

Volatile Organic Compounds

Volatile organic compound (VOCs) results for Greys Landfill are presented in Appendix D and posted on maps for shallow (Figure 12) and intermediate (Figure 13) wells to facilitate the review of impact to groundwater in these zones. Data posted on Figures 12 and 13 include only the maximum concentration of any individual VOC compound for the 1st half 2013 period.

VOC results are shown for the shallow groundwater monitoring wells at Greys Landfill in Figure 12. For the shallow zone, review of the maps shows that three wells located on the northern side of the landfill exhibit the highest concentrations of VOCs. These wells include GL-08 (-3), GL-17 (-1) and GL-18 (-3). The highest VOC concentration detected was at well GL-17 (-1) which had a benzene concentration of 8,280 ug/L. This well has had historically high benzene concentrations, with little deviation in the concentration values over the last four years. Groundwater in this area is flowing to the northwest. It is evident from the maps that VOC impact is significantly attenuated with distance from the landfill in the shallow zone. There is a significant decrease in VOC concentration as groundwater in the shallow zone moves down gradient from well GL-17 (-1) towards Bear Creek. It is also evident from the maps that there is minimal or no VOC impact in the shallow zone south of the landfill or west of the landfill, adjacent to Bear Creek.

VOC results are shown for the intermediate groundwater monitoring wells at Greys Landfill in Figure 13. For the intermediate zone, VOC concentrations are significantly lower than in the shallow zone, with the highest individual VOC concentration in March 2013 being 48.6 ug/L benzene in GL-17 (-31). Although the water level data cited in Section 4.1 indicate the potential exists for downward migration of groundwater from the shallow wells towards the intermediate wells, the VOC impact to the intermediate wells is relatively muted. This indicates that the intervening (generally lower permeability) geologic materials between the shallow and intermediate well screens resist groundwater flow and contaminant migration.

SVOCs

Semi volatile organic compounds (SVOCs) results for Greys Landfill are presented in Appendix E. SVOCs compounds are not listed as part of the Table I and Table II requirements outlined in the December 3, 2012 letter; however a subset of the groundwater monitoring wells was sampled based on recommendations from a previous groundwater compliance report for Greys Landfill published in 2011.

Six groundwater monitoring wells had samples collected and analyzed for SVOCs during the March 2013 sampling event. The wells sampled for SVOCs include GL-08(-3), GL-09 (-02), GL-17(-1), GL-18(-3) and GL-20(-5) located in the shallow zone and GL-17(-31) located in the intermediate zone. SVOC results for Greys Landfill are posted on the maps for shallow (Figure 12) and intermediate (Figure 13) wells to facilitate the review of impact to groundwater in these zones.

SVOCs were detected in the six groundwater monitoring wells. The data indicate the wells most impacted by SVOCs are GL-08 (-3), GL-17 (-1) and GL-18 (-3) located in the shallow zone, north and northeast of the landfill. The highest SVOC concentration detected in the shallow zone was at well GL-08 (-3) with a naphthalene concentration of 2,580 ug/L. This well has had historically high concentrations of naphthalene, with little to no deviation of the detected values over the past four years.

One well in the intermediate zone was analyzed for SVOCs during the March 2013 sampling event; which was well GL-17 (-31). The only SVOC concentration detected was 3 ug/L of 2,4-Dimethylphenol. Based on review of the historical data for SVOC detections in the intermediate zone, there have been minimal or no SVOC detections since 2010.

Inorganics

Inorganic compound data for Greys Landfill are presented in Appendix F. Individual results for arsenic, chromium and lead are posted on maps for shallow (Figure 14) and intermediate (Figure 15) groundwater monitoring wells to facilitate the review of impact to groundwater in these zones. These metals were selected as representative analytes that provide notable indications of impacts to groundwater either from former site activities or baseline conditions at the site.

Review of the data tables in Appendix F reveals widespread low-level detections of many metals. The hydraulic gradient at the site reveals a groundwater mound in shallow groundwater zones, so up gradient / down gradient comparisons are not direct.

Review of the representative metal data shown in Figure 14 indicates that in the shallow wells all wells except for two had at least one detection of an indicator metal. The highest indicator metal concentration was found in well GL-17 (-1) with an arsenic concentration of 0.016 mg/L. The two wells with indicator metal concentrations below the detection limit were wells GL-13 (+1) and GL-14 (+1).

Representative indicator metal compounds were also detected in the intermediate groundwater with the exception of two locations (Figure 15). The highest indicator metal concentration was found in well GL-11 (-33) with a lead concentration of 0.0148 mg/L. The two wells with indicator metal concentrations below the detection limit were wells GL-12 (-17) and GL-13 (-26). Generally, concentrations of indicator metal compounds were lower in the intermediate groundwater zone than the shallow zone.

5.0 Historical Trends and Analysis

The following sections provide a discussion and analysis of general historical trends in the data by comparing data collected and reported by previous owners of the landfills to the 1st half 2013 data. Analysis, such as intrawell statistical methods, will be completed in the future when additional data has been collected to provide sufficient input for a statistically valid data set.

5.1 Coke Point Landfill

VOC groundwater monitoring data has remained fairly consistent with a possible exception at monitoring well CP08-PZM008 located on the east side of the landfill. This well has shown an increasing concentration of benzene over the last three sampling events, which have occurred between April 2011 and March 2013. Benzene concentrations have risen from a concentration of 15,000 ug/L in April 2011 to a concentration of 23,900 ug/L in March 2013. However, this increasing trend was not consistently noted in the monitoring wells for both the shallow and intermediate zones located in possible downgradient locations adjacent to the shoreline (shallow CP12-PZM012, CP14-PZM009 and intermediate CP12-PZM052, CP14-PZM062 and CP16-PZM035). Wells CP12-PZM012 and CP16-PZM035 exhibited decreasing trends of benzene concentration (58 ug/L to 16.5 ug/L and 290 ug/L to 229 ug/L respectively), CP14-PZM009 was consistent (59 to 59.8 ug/L). Other intermediate wells at Coke Point Landfill have remained at non-detectable levels of benzene.

Historical trends of significance (either increasing or decreasing) were not noted for the SVOC or inorganic groundwater monitoring data for both the shallow and intermediate zone at Coke Point Landfill.

5.2 Greys Landfill

Historical trends observed for Greys Landfill groundwater monitoring data were the consistent detection of VOC and SVOC constituents at wells GL-08 (-3), GL-17 (-1) and GL-18 (-3); all of which are located in the shallow zone. VOC and SVOC data have remained around the same concentrations since July 2009. Well GL-17 (-31), located in the intermediate zone, continues to have VOC and SVOC concentrations above the detection limits. These concentrations are relatively low and also have seen no significant change in concentration since July 2009.

Historical trends of significance (either increasing or decreasing) were not noted for the inorganic groundwater monitoring data for both the shallow and intermediate zone at Greys Landfill.

6.0 Recommendations

The groundwater monitoring program for both Coke Point and Greys Landfills is adequate as currently implemented. Groundwater wells are adequately located to monitor impacts to both shallow and intermediate groundwater zones at potential downgradient locations from the landfills.

Additional semi-annual monitoring data is required to provide statistical trends analyses for the landfills as requested in the MDE correspondence dated December 3, 2012. The monitoring program will be implemented as currently configured in the 2nd half of 2013 to collect additional data.

Notes

Aquifer terminology based on that used in the CH2MHill 2002 Report. NA = not available.

Survey information from Table 2-3 of the URS 2005 Nature and Extent Report, except for CP10 PZM008 (from CH2MHill 2002)

Well Construction information from Table A-1 of the CH2MHill 2002 Release Site Characterization report. H-SA = hollow-stem auger. DP = direct push.

Notes

1 = The number in parentheses is the elevation of the bottom of the screen. Wells have been grouped as shallow (S) and intermediate (I) wells, for evaluation of Greys Landfill. 2 = Information obtained from URS, Baker Engineers, SAIC, and CH2MHill well location and elevation data obtained from Stevens Painton Corporation Well Survey conducted October 19 & 20, 2009, except for GL-19.

Source of Survey Information
 Well location and elevation data obtained from Stevens Painton Corporation Well Survey conducted October 19 & 20, 2009, except for GL-19
 Well location and elevation data for GL-19 obtained from CH2MHill, 2005. MP in the CH2MHill report is assumed to be the measurement point at the top of PVC casing.
