NOTICE OF INTENT

General Discharge Permit for Animal Feeding Operations (AFOs) (19AF, AIDGOI)

Land and Materials Administration - Resource Management Program

Issued Pursuant to Title 9, Environment Article, Annotated Code of Maryland, and Code of Maryland Regulations (COMAR) 26.08.04

Submission of this Notice of Intent (NOI) constitutes notice that the person identified in this form intends to operate under and comply with all terms and conditions of the State/NPDES General Discharge Permit for AFOs (AFQ Permit). The discharge of animal waste, including manure, poultry litter, and process wastewater to waters of the State is prohibited unless an AFO has been registered under the AFO Permit by the Maryland Department of the Environment ("MDE"). A person shall hold a CAFO discharge permit issued by MDE before beginning construction on any part of a new CAFO.

Please submit this completed NOI Form to the following address:

Maryland Department of the Environment Land and Materials Administration/AFO Division 1800 Washington Boulevard, Suite 610 Baltimore, Maryland 21230-1719 General Information Al Number: __/56939 AFO DIVISION LEGAL Name of Applicant (must match name on required plan): CARABALO Farms, LLC AFO Type (circle one): (CAFO)/ MAFO New Coverage see column 'A' in Ouestion 4 3. CAFO permit opplication requirements at 40 CFR \$122.21(i)(1)(r) specify that applications for coverage (including NOIs) must include nutrient management plans (NMPs) that at a minimum satisfy the requirements specified in 40 \$122.42(c).

Comprehensive Nattient Management Plans (CNMPs), as defined in the General Discharge Permit for Animal Feeding Operations (AFOs) (19AF, MDG01), satisfy these requirements. An application will not be processed until a completed NOI form and a current CNMP are received. A CNMP must be developed by a certified and licensed plan writer, and in addition to the federal requirements, must satisfy the nutrient management requirements in COMAR 15.20.07 and 15.20.08.

Permit Number: 19AF/MDG01 Date: July 8, 2020 TTY Users: 800-735-2258

Certification

By signing this form. I the applicant or duly authorized representative, do solemnly affirm under the penalties of perfury that the contents of this application are true to the best of my knowledge, information, and belief. I hereby authorize the representatives of AIDE to have access to the AFO and associated latafacilities (forms) for Inspection and to records relating to this application at any reasonable time. I in knowledge that depending on the type of permit applied for, other permits or approvals may be required any reasonable time. I in knowledge that depending on the type of permit applied for, other permits or approvals may be required. The personal information requested on this form is intended to be used in processing your NOL. This Natice is provided all Title 4 of the General Provisions Article, Annualted Code of Aluryland. Your NOL may not be processed if you fall to provide all requested information, have the right to inspect, anend, or correct this form. AIDE is a public agency and subject to the Islamyland Public Information Act (Ald. Code Ann., Gen. Prov. §§ 4-101, et seq.). This form may be made available on the Internet via AIDE's website and to subject to inspection or copylug. In whole or In part, by the public and other governmental agencies, if not otherwise perfected by Subject or State how.

Plan Date: January 2021

Poultry Operation (No Land Plan)

Concentrated Animal Feeding Operation (CAFO)
Agency Interest # 156939

COMPREHENSIVE NUTRIENT MANAGEMENT PLAN

FOR

Caraballo Farms, LLC Derek L. Caraballo

PREPARED BY THE

Caroline Soil Conservation District 9194 Legion Road Denton, MD 21629

> Plan Date: January 2021

SECTION 1: CNMP Purpose and Agreement

The Comprehensive Nutrient Management Plan (CNMP) is an important part of the conservation management system (CMS) for your Animal Feeding Operation (AFO). This CNMP documents the planning decisions and operation and maintenance for the AFO.

Trols CNMP is valid as long as there are no major changes to the operation. A plan revision will be needed when the numbers of animals deviates by 10% from the planned amount or when the operation changes from one type of livestock to another. Annual revisions will be necessary for the nutrient management system in order to account for crop changes and soil sample result changes.

This CNMP was developed paying special attention to the USEPA's required nine minimum practices for water quality protection. This plan when implemented by Derek L. Caraballo will ensure clean runoff is diverted from manure storage and production areas and livestock are prevented from making direct contact with waters:

Owner/Operator

As the owner/operator of this CNMP, i, as the decision-maker, I have been involved in the planning process and agree that the items/practices listed in each element of the CNMP are needed. I understand that I am responsible for keeping all necessary records associated with the implementation of this CNMP. It is my intent to implement/accomplish this CNMP in a timely manner as described in the plan.

Tolan Shepare)

Date

SECTION 2: Farmstead (Production Area)

This element addresses the components and activities associated with the production facility, feedlot or animal loafing facilities, manure and wastewater storage and treatment structures and areas, animal mortality facilities, feed and other raw material storage areas, and any areas used to facilitate transfer of manure and wastewater.

Farm Locations

Farm Name	Farm Operator	Tax Account ID	Farm #	Tract #	Account ID Acres	Watershed
Caraballo Farms, LLC	Derek Caraballo		2786	1359	39	02-13-04- 04-0490

Description of Operation / Additional Information

Derek Caraballo operates this 4 house poultry farm. He grows an average of 211,600 broilers per flock for Perdue Farms. He averages 6.7 flocks per year. This is a no land operation. All manure is exported. Of the total 39 acres, 16 acres are cropland and managed and controlled by Chip Eaton of 24235 Holsinger Lane, Ridgely, MD 21660. The poultry headquarters is approximately 16.5 acres, the remaining 6.5 acres is woodland.

Sensitive Environmental Information

Name of nearest regulatory waterbody	Distance to nearest regulatory waterbody (ft.)	Distance to nearest regulatory wetland (ft.)
Herring Run	680'	780'

			Tier II		Impairr	ments

Animal Production

Poultry

Bird Type	Average Bird Weight (lbs)	Number of Houses	Total Number of Birds (All Houses)	Number of Flocks per year	Manure Generated/Produced (tons/year)*	Manure Available for Utilization/Removed (tons/year)**
Broiler	4	4	211,600	6.7	1307	See manure generation worksheet - no manure is planned to be removed until a total cleanout in 2021.

^{*} See poultry litter quantity estimation sheets in the "Nutrient Management" section of this plan.

Operators must keep records of the actual:

- 1. Quantity estimate of litter removed from production and/or storage facility; and
- 2. Date of removal of litter from production and/or storage facility.

Manure Collection

Mr. Caraballo uses a combination of windrowing and litter saving between flocks. No manure is removed from the houses. There hasn't been a center cut and it is not anticipated to be done. A total cleanout is planned for 2021.

Manure Storage

Manure from cleanout can be stored in either of the 2 50' \times 80' Poultry Waste Storage Structures on the farm, until it can be exported to the receiving farmer.

Current / Proposed Manure Storage Conditions

Animal Type	Storage Structure	Size of Storage Structure	Storage Capacity	Date Constructed
Poultry	Poultry Waste Storage Structure	50 x 80	23200	4/09/2019
Poultry	Poultry Waste Storage Structure	50 x 80	23200	4/09/2019

IMPORTANT! Manure should not be stockpiled or staged anywhere in the production area other than permanent manure storage structure for any length of time.

Transfer Information (Farm(s) receiving exported manure)

Animal Type	Name	Address
Poultry	Chip Eaton	24235 Holsinger Lane, Ridgely, Maryland

Animal Mortality Disposal

Animals die because of disease, injury, or other causes in any confined livestock operation. The mortality rate is generally highest for newborn animals because of their vulnerability.

Catastrophic mortality can occur if an epidemic infects and destroys a large portion of the herd or flock in a short time, or if a natural disaster, such as a flood or excessive heat strikes. There are also incidences when an entire herd or flock must be destroyed to protect human health or other farms in the area.

Methods for managing mortality include:

- 1. Rendering
- 2. Composting
- 3. Incineration*
- 4. Sanitary landfills
- 5. Burial**
- 6. Disposal pits**
- * Incineration may only be used with proper equipment and permits must be obtained by the producer.
- ** Burial and Disposal pits should only be considered for catastrophic mortality if all other methods are not possible. Derek L. Caraballo will follow local and state guidance if it is determined that burial is an acceptable means of disposal.

Typical Mortality Management

Current Normal Mortality Disposal Method(s)

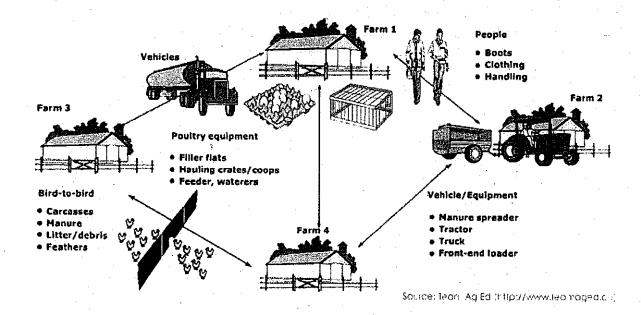

Animal Type	Disposal Method	Number of Bins/Capacity	Location of Disposal/Facility
Poultry	Composting - Bins/Channels	32' Channel	Attached to PWSS on North side of the operation

Catastrophic Mortality Management

In the event of catastrophic mortality, the operator will Contact the integrator and most likely, follow an 'in house' or 'in PWSS' windrow method of composting as outlined in UMD-Ext fact sheets #723 and #801. If 'in PWSS' composting is used, MDE must be notified for approval.

transmission of disease. An outbreak of animal disease could not only harm your livestock, it could affect other nearby animals and quickly spread through your area. The economic consequences of a disease outbreak could be devastating. Taking common sense precautions to prevent disease from coming onto your farm is the best investment you can make.

How Diseases Spread (Example - Poultry Operation)

Steps to Take to Avoid Disease Spread

To reduce the risk of introducing disease entering into an animal feeding operation, maintain a biosecurity barrier (physical barrier, personal hygiene, and equipment sanitation) between wildlife, animals, animal containment areas, and other commercial facilities. Some examples of good biosecurity practices include:

- 1. Permit only essential workers and vehicles on the premises.
- 2. Give germs the boot
 - a. Keep a pair of shoes or boots to wear only around your animals.
 - b. Clean and disinfect your shoes often.
 - c. Always ask visitors and employees to clean their boots and shoes.
- 3. Don't haul home disease
 - a. Always clean and disinfect vehicles used for moving animals.
 - b. Limit traffic of incoming people, products and vehicles that could bring in a disease.
 - c. Clean and disinfect all equipment that comes in contact with your animals.
- 4. Keep your farm secure
 - a. Restrict access to your property and animals.
 - b. Keep doors and gates locked.
 - c. Have tracking records on animals.
 - d. Give germs space Newly acquired animals should be isolated for at least two weeks to ensure you don't introduce disease to your main herd or flock. As an added protection, isolate and quarantine new animals for 30 days before putting them with your other animals. Keep show animals segregated for at least two weeks after they've been to a fair or exhibit.

- b. Sudden, unexplained death loss in the herd or flock
- c. Severe illness affecting a high percentage of animals
- d. Blisters around an animal's mouth, nose, teats or hooves
- e. Staggering, falling or central nervous system disorders that prevent animals from rising or walking normally.
- f. Large number of dead insects, rodents or wildlife
- 6. Don't wait call in signs of disease immediately. Do not self-diagnose. Seek veterinary services, as early detection is your best protection. If you have animals with signs of suspect disease, call your local veterinarian, UMD extension agent () or the state veterinarian. Rapid response and investigation are the only ways to control and eliminate disease and stop large numbers of casualties or damage to our economic system.

Comprehensive Nutrient Management Plan - Written(102)

Obtain a comprehensive nutrient management plan (CNMP) that describes and documents a conservation system within a conservation plan that is unique to animal feeding operations. The CNMP addresses all aspects of the Animal Feeding Operation including manure handling, nutrient management, feed management, and other conservation practices. Maryland Department of the Environment requires that a CNMP that is developed to meet EPA/MDE CAFO regulatory requirements to control soil erosion and protect water quality must be implemented as scheduled. Any CNMP components that are funded through costshare programs must also be implemented as scheduled.

Heavy Use Area Protection(561)

Construct a heavy use area (poultry pad) at the location(s) shown on the plan map where poultry manure and other waste products are handled. The poultry pad will protect the soil from erosion and reduce nutrient contamination of surface and groundwater. Pads will be designed and installed according to NRCS standards and specifications, and will be maintained according to the attached Operation and Maintenance plan. Plan to cost share through MACS pads on the "A" ends of houses 1-4, "B" ends of houses 3& 4, and the PWSS & DBCF pads. The pads-on "B" end-of houses 1 & 2 will self funded or applied for through EQIP at a later date:

Caroline County, Maryland

[Minor map unit components are excluded from this report]

Map unit: CrA - Corsica mucky loam, Carolina Bay, 0 to 2 percent slopes

Component: Corsica, undrained (50%)

The Corsica, undrained component makes up 45 percent of the map unit. Slopes are 0 to 2 percent. This component is on Carolina Bays, uplands. The perent material consists of loamy fluviomenine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is very poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches is high. Shrink-swell potential is low. This soil is not flooded. It is frequently ponded. A seasonal zone of water saturation is at 0 inches during January, February, March, April. Organic matter content in the surface horizon is about 38 percent. Nonirrigated land capability classification is 4w. This soil meets hydric criteria.

Component: Corsica, drained (25%)

The Corsica, drained component makes up 30 percent of the map unit. Slopes are 0 to 2 percent. This component is on Delmarva Bays, uplands. The parent material consists of loamy fluviormanne sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is very poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches is high. Shrink-swell potential is low. This soil is not flooded. It is rarely ponded. A seasonal zone of water saturation is at 5 inches during January, February, March. Organic matter content in the surface horizon is about 14 percent. Nonirrigated land capability classification is 3w. This soil meets hydric collection.

Map unit: FaA - Fallsington sandy loam, 0 to 2 percent slopes

Component: Fallsington, undrained (40%)

The Fallsington, undrained component makes up the control of the min. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of themy fluor material sections. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water riove and the state statictive layer is moderately high. Available water to a depth of 60 inches is moderate. Shrink-swell potential is inc. This parties act fooled it is occasionally pended. A seasonal zone of water saturation is at 5 inches during January, February. When Apr. Capena matter content in the surface honzon is about 68 percent Nonirrigated land capability classification is 5w. This soil meets by the criteria.

Component: Fallsington, drained (40%)

The Fallsington, drained component makes up 40 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of loamy fluviomanne sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches is moderate. Shrink-swell potential is low. This soil is not flooded. It is rarely ponded. A seasonal zone of water saturation is at 14 inches during January, February, March, April. Organic matter content in the surface horizon is about 2 percent. Nonirrigated land capability classification is 3w. This soil meets hydric criteria.

Map unit: HbA - Hambrook sandy loam, 0 to 2 percent slopes

Component: Hambrook (80%)

The Hambrook component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of loamy fluviamenne sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches is moderate. Shrink-swell potential is low. This soil is not flooded. It is not pended. A seasonal zone of water saturation is at 45 inches during January. Organic matter content in the surface horizon is about 2 percent. Nonirrigated land capability classification is 1. Irrigated land capability classification is 1. This soil does not meet hydric criteria.

Map unit: HbB - Hambrook sandy loam, 2 to 5 percent slopes

Component: Hambrook (80%)

The Hambrook component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on uplands, flats. The parent material consists of loamy fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage

class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 45 inches during January. Organic matter content in the surface horizon is about 2 percent. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria.

Map unit: HbC - Hambrook sandy loam, 5 to 10 percent stopes

Component: Hambrook (80%)

The Hambrook component makes up 80 percent of the map unit. Slopes are 5 to 10 percent. This component is on knolls, uplands. The parent material consists of loamy fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 45 inches during January. Organic matter content in the surface horizon is about 2 percent. Nonirrigated land capability classification is 3e. It is not ponded that capability classification is 3e. This soil does not meet hydric criteria.

Map unit: ieB - Ingleside loamy sand, 2 to 5 percent slopes

Component: Ingleside (75%)

The Ingleside component makes up 75 percent of the map and. Slopes are 2 to 5 percent. This component is on uplands, flats. The parent material consists of loamy epitan deposits and/or fluviormating sudiments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement with most restrictive layer is moderately low. Available water to a depth of 60 inches is moderate. Shrink-swell potential is low. This sections for the not ponded. A seasonal zone of water saturation is at 45 inches during January. Organic matter content in the sections house of solution is 20. Intigated land capability classification is 20. This sections not meet hydric criteria.

Map unit: LgA - Lenni loam, 0 to 2 percent slopes

Component: Lenni, undrained (50%)

The Lenni, undrained component makes up 50 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of clayey fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer moderately low. Available water to a depth of 60 inches is moderate. Shrink-swell potential is low. This soil is not flooded. It is occasionally ponded. A seasonal zone of water saturation is at 5 inches during January, February, March, April. Organic matter content in the surface horizon is about 94 percent. Nonimigated land capability classification is 4w. This soil meets hydric criteria.

Component: Lenni, drained (35%)

The Lenni, drained component makes up 35 percent of the map unit. Slopes are 0 to 2 percent. This component is on uplands, flats. The parent material consists of clayey fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches is moderate. Shrink-swell potential is low. This soil is not flooded. It is rarely ponded. A seasonal zone of water saturation is at 14 inches during January, February, March, April. Organic matter content in the surface horizon is about 6 percent. Nonirrigated land capability classification is 3w. Irrigated land capability classification is 3w. This soil meets hydric criteria.

Map unit: WdA - Woodstown sandy loam, 0 to 2 percent slopes

Component: Woodstown (85%)

The Woodstown component makes up 85 percent of the map unit. Slopes are 0 to 2 percent. This component is on shallow depressions, uplands, flats. The parent material consists of loamy fluvlomarine sediments loamy. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 Inches during February. Organic matter content in the surface horizon is about 2 percent. Nonirrigated

Component: Woodstown (85%)

kend capability classification is 2a, impaied and capability classification is 2a. This soil does not meet highic calability.

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this report, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

The Map Unit Description (Brief, Generated) report displays a generated description of the major soils that occur in a map unit. Descriptions of non-soil (miscellaneous areas) and minor map unit components are not included. This description is generated from the underlying soil attribute data.

Additional Information about the map units described in this report is available in other Soil Data Mart reports, which give properties of the soils and the limitations, capabilities, and potentials for many uses. Also, the narratives that accompany the Soil Data Mart reports define some of the properties included in the map unit descriptions.

The schedule of conservation practices presented here has been reviewed by Derek L. Caraballo, Who is responsible for compliance with the requirements of the agricultural farm operation.

I. Derek L. Garaballo, certify that as the decision-maker, I have been involved in the planning process and agree that the items/practices listed in the table above are needed on my farm operation. Lunderstand that I am responsible for implementing these practices according to the screening above. Should I not be able to implement any of the above items according to the schedule; I will contact the Caroline Soil Conservation District and have this schedule revised.

Derek L. Caraballo

//zo/zi Date

Operation and Maintenance for BMP's in Farmstead

This section addresses the operation and maintenance for the structural, non-structural, and land treatment measures for your farm. These documented measures require effort and expenditures throughout the life of the practice to maintain safe conditions and assure proper functioning. Operation includes the administration, management, and performance of non-maintenance actions needed to keep a completed practice safe and functioning as planned. Maintenance includes work to prevent deterioration of practices, repairing damage, or replacement of the practice if one or more components fail.

Waste Storage Facility (313)

- Check backfill areas around the structure (concrete, steel, timber, etc.) frequently for excessive settlement. Determine if the settlement is caused by backfill consolidation, piping, or failure of the structure walls or floor. Necessary repairs must be made.
- Check walls and floors often minimum of 2 times a year when facility is empty for cracks and/or separations. Make needed repairs immediately.
- Outlets of foundations and sub-drains should be checked frequently and kept open. The outflow from these drains should be checked when the facility is being used to determine if there is leakage from the storage structure into these drains, Leakage may be detected by the color and smell of the out-flowing liquid, by lush dark-green growth of vegetation around the outlet, by the growth of algae in the surface ditch, or by the vegetation being killed by the out-flowing liquid. If leakage is detected, repairs should be planned and made to prevent the possible contamination of groundwater. To prevent erosion, a good vegetative cover should be established and maintained on berms and embankments. Plantings should be clipped 3 times a year to kill noxious weeds and encourage vigorous growth. If the vegetation is damaged, berms and embankments will need to be re-vegetated as soon as possible.
- Fences should be inspected and maintained in order to exclude livestock from the berms and embankments and to exclude unauthorized entry by people.
- Check the channels and berms of the clean water diversions around the barnyard, buildings and storage structure frequently. Channels must be protected from erosion and berms must be maintained at the proper height to ensure adequate capacity. These channels and berms should not be used as haul roads unless they are designed and constructed for this purpose.
- Check frequently for burrowing animals around buildings, structures, and in the berms and embankments. Remove them when they are found and repair any damage.
- Inspect haul roads and approaches to and from the storage facility frequently to determine the need for stone, gravel or other stabilizing material.
- Do not allow runoff from loading areas and from spills to flow into streams or road ditches.
- · Examine and repair all warning and hazard signs as needed.
- Install and maintain a marking gauge post that clearly shows the design levels of one-half and full for manure storage pits, ponds, and lagoons.
- · Clear blockages from roof gutters and outlets as needed.
- · Notify the Soil Conservation District of any major problems or repairs needed.
- The roof must be maintained to operate as intended for the life of the practice (15 years). The function of the roof is critical because the manure storage facility is sized accordingly.

Animal Mortality Facility (316)

- Facilities for normal mortality will be operated or used on a regular basis. At each operation or use, inspect the facility
 to note any maintenance needs or indicators of operation problems, and promptly make repairs or adjustments to
 operation of the facility.
- · Follow the management plan requirements for:
- The mix proportions, moisture requirements, and materials used.
- · The sizing requirements.
- The timing of the disposal/utilization process including loading, unloading, and turning or aeration of the material.
- · Temperature monitoring requirements, including a temperature log.
- What must be done to prevent scavenging animals and leachate problems.
- · Bio-security requirements,
- If catastrophic mortality occurs, contact NRCS or the Soil Conservation District for assistance concerning proper disposal of the mortality.

- Inspect the Heavy Use Area at least twice a year and after severe storm events.
- Scrape the surface as needed to remove excess manure and/or sediment.
- Repair paved areas by repairing holes and replacement of paving materials.
- Replace loose surfacing material such as gravel, cinders, sawdust, tanbark, etc. as needed when removed by livestock, equipment traffic, or scraping.
- · Repair any deteriorating areas.
- Maintain all vegetation that is part of the plan by fertilizing and liming according to soil test recommendations and reseeding or replanting as necessary.
- Inspect inlets and outlets of pipes and culverts and remove any obstructions present.
- Maintain flow into filter areas by removing accumulated solids, reconstructing waterbars, etc.

SECTION 3: Land Treatment Area (Crop and/or Pasture)

This element addresses evaluation and implementation of appropriate conservation practices on sites proposed for land application of manure and organic by-products from an Animal Feeding Operation. On fields where manure and organic by-products are applied as beneficial nutrients, it is essential that runoff and soil erosion be minimized to allow for plant uptake of these nutrients.

This CNMP is considered a "No Land" plan, therefore no additional documents have been included in this section.

SECTION 4: Nutrient Management

This element addresses the Nutrient Management component of the CNMP. The nutrient management plan is developed by a Maryland Department of Agriculture certified nutrient management consultant.

Soil Sampling and Testing

Maryland Department of Agriculture regulations require up-to-date soil analyses be included in the Nutrient Management Plan. To fulfill this requirement you must follow these guidelines:

- 1. Soil test(s) are required to be taken every 3 years or sooner for each management unit;
- 2. It is recommended that soil sampling be conducted consistently at the same time of the year;
- Soil sampling depth for P and K shall be 8 inches;
- 4. pH testing sampling depth for no-till is only 4 inches.

Soil testing shall include analysis for any nutrients for which specific information is needed to develop the plan. The minimum analysis for Maryland is to include: <u>pH. organic matter.</u> <u>phosphorus, potassium, calcium, magnesium, and CEC.</u>

Manure and Wastewater Testing/Analysis

Maryland Department of the Environment and the Environmental Protection Agency require an analysis of manure generated on your operation be obtained to meet conditions in a General Discharge Permit for Animal Feeding Operations under CAFO regulations. If you land-apply manure, it is a required component of your NMP according to MDA regulations. To fulfill this requirement you may do one of the following:

- Collect a sample of manure and obtain an analysis OR
- 2. If exported, obtain a copy of the manure analysis from one of the farmers who will be receiving the manure from your operation

Manure should be analyzed on an annual basis from each storage structure for: % Solids or % Moisture, Total N, Organic N, NH_4 or NH_3 , P_2O_5 , K_2O , and pH. These analyses are part of the required Record Keeping and are stored under the Record Keeping element of this CNMP.

Description of Chemical Handling:

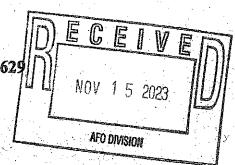

All chemicals are custom applied and no chemicals are stored at the operation.

TALBOT SOIL CONSERVATION DISTRICT 28577 Marys Court • Suite 3 • Easton, Maryland 21601 410-822-1577 x 5 • http://www.talbotscd.com NUTRIENT MANAGEMENT PLAN

for

Derek L. Caraballo Caraballo Farms, LLC 9204 Willoughby Road. Denton. MD 21629

> Farm Address: 9270 Willoughby Road Denton, MD 21629

DESCRIPTION OF OPERATION: This plan is for a no-land poultry operation located in Caroline County. The farm is located northwest of the corner of Willoughby Road and Hobbs Road in Denton, MD. It includes 4 poultry houses with a capacity of 211,600 broilers per flock.

Cropland associated with this property is rented by the following operator and must be included in his nutrient management plan: Chip Eaton, 24235 Holsinger Ln., Ridgely, MD 21660

This nutrient management plan is one of the required plans needed for a CAFO permit 19AF. It is Mr. Caraballo's responsibility to send a copy of this plan to Maryland Department of the Environment (MDE) and Maryland Department of Agriculture (MDA) Nutrient Management Program. Reference AI ID Number 156939.

DATE OF PLAN: November 13, 2023

DURATION OF PLAN: November 13, 2023-November 12, 2026

An immediate update will be needed if a change in average annual number of animal units of 10 percent or greater occurs and if resultant manure production will require significant management adjustments.

MANURE SAMPLING AND TESTING: Maryland Department of the Environment and the Environmental Protection Agency require that CAFO operations have a copy of an analysis of the manure generated on the operation in their records. Operator may either collect a sample of manure before it is transported off-farm and obtain an analysis or obtain a copy of the manure analysis from one of the persons who will be receiving the manure from the operation. A copy of each year's manure analysis must be submitted with each year's Annual Implementation Report (AIR).

MANURE MANAGEMENT: Manure that is collected from the poultry houses is stored in the manure sheds until it is taken to the receiving farm. This operation includes 2 manure sheds, each with a capacity of 50 ft. x 80 ft., total storage capacity 40,000 cu. ft., and a 32 ft. channel composter.

Manure is ground with a Litter Saver and/or windrowed between flocks. A center cut will occur every year removing 50% of the manure from the houses. A complete cleanout

occurred in 2023 and the next total cleanout is expected in 2029

The operator must keep records of the quantity, date, and destination of manure removed from the houses and off the farm. Manure is exported to the following receiving facility or farm as available: Chip Eaton, 24235 Holsinger Ln., Ridgely, MD 21660

FIELD STORAGE OF LITTER: Refer to the General Discharge Permit for Animal Feeding Operations for information for the requirements for field storage or stacking of litter.

BEST MANAGEMENT PRACTICES: Mr. Caraballo must consult either the USDA-Comprehensive Nutrient Management Plan (CNMP) or Soil Conservation Water Quality Plan for this information.

RECORD KEEPING REQUIREMENTS: The Water Quality Improvement Act requires that producers maintain records on manure management, animal numbers, and manure quantity.

The operator must keep records of the quantity, date, and destination of litter as it is removed from the production houses to either storage sheds or off-farm locations. Maryland Department of Agriculture (MDA) requires operators to report this information in their Annual Implementation Report (AIR) due to MDA March 1 each year. The Litter Removal Data Sheet in the Recordkeeping section of this plan can be used for tracking movement of litter.

Refer to the General Discharge Permit for Animal Feeding Operations for information for the type of records that are required by MDE and EPA.

^{***} Cake/Crust not removed due to windrowing, is added with the litter remaining in the house the following year. Windrowing may likely result in actual quantities of litter being less than the estimates shown here. The actual amount of Cake/Crust removed may also be less than the estimated amounts produced due to improved drinker systems, ventilation, etc.

Caraballo Farm, LLC

T-1359 Total Acres: 0.0 Willoughby Road Denton, MD 21629

Supplements that may be included in the delivered Nutrient Management Plan:

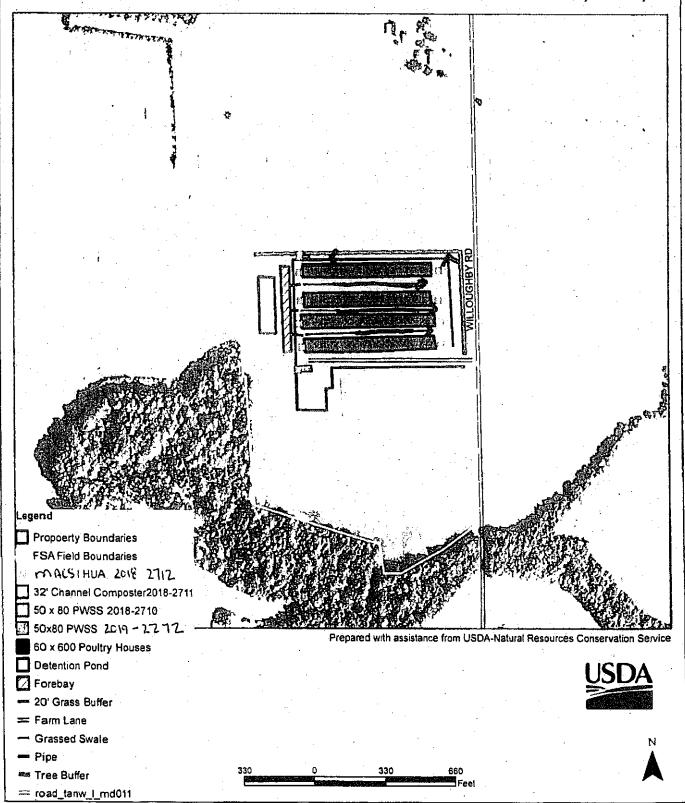

- 1. MDA 's\MDE Nutrient Application Guidelines
 - a. Farming With Your Nutrient Management Plan
 - b. August, 2016 Nutrient Application Requirements
 - c. MDE setback standards for CAFO\MAFO
- 2. Recordkeeping, Application Variances, Inspection
 - a. Field-By-Field Nutrient Application Record Form Definitions
 - b. Field-By-Field Nutrient Application Record
 - c. Grain Yield Calculation Sheet
 - d. Forage Yield Calculation Sheet
 - e. MDA Variance for Commercial Fertilizer Nutrient Application
 - f. Variance for Animal Manure Nutrient Application
 - g. Plan Implementation Review Process for Operators
 - h. Nutrient Management Plan Maintenance and Annual Reporting Requirements
 - i. Poultry Operations
 - i. MDA Poultry Operation Record Keeping Guide
 - ii. Poultry Litter Removal Data Collection Sheet
- 3. General Principles
 - a. General Principles of Nutrient Management

Water Conveyance Map
Field Office: CAROLINE COUNTY SERVICE CENTER

Customer(s): CARABALLO FARMS LLC

Approximate Acres: 39 Farm 2786 Tract 1359 Opid: Hobbs-10

Date: 4/21/2017 Assisted By: Alison Taylor

SECTION 5: Additional Documentation

This section is included if there are additional documents needed for the Comprehensive Nutrient Management Plan.

The following documents are located in this section:

- Water Conveyance Map Around Production Area
- Monthly Animal & Mortality Count
- Weekly Storage Form
- Manure Litter Storage Form
- Manure Litter Transfer Form
- Daily Waterline Form

MDE SELF INSPECTION AND RECORDKEEPING REQUIREMENTS FOR LAND & NO-LAND OPERATIONS

			Applicable to Liquid/Dry Manure Handling or
Туре	Maintain Records of:	Frequency	Both
Land & No-Land	Any transfers of manure, litter, and process wastewater, will include the following information: 1.) Name and address of recipient and 2.) Date and quantity transferred. The permittee shall supply the recipient of the animal waste with the most recent annual nutrient analysis of the manure, litter, or process wastewater. If the recipient performs the analysis, the permittee shall obtain a copy and maintain it as part of the permittee's records.	Each occurrence	Both
Land	Each application event where manure, litter, or process wastewater is applied. Including 1.) Fields where animal waste is distributed, using field names consistent with those in the required plan, 2.) Application method, rate, time and date, 3.) Soil conditions, including instances of ponding or runoff, saturated soil, and frozen ground or snow covered ground and 4.) Weather conditions, including precipitation and temperature at the time of application and precipitation 24 hours prior to, and following, application.	Each land application event	Both
No-Land	Manure samples shall include the following information, 1.) Date sample taken, 2.) Test methods used to sample and analyze manure, litter, and process wastewater; and 3.) Results from manure, litter, and process wastewater sampling.	Annually	Both
Land & No-Land	Mortality disposal including date, numbers of animals, and method of disposal	As necessary	Both
Land & No-Land	Inspections conducted, including date, of the animal waste storage areas	Weekly	Both
Land	The results of manure samples and soil samples, including the following information, 1.) Date sample taken, 2.) Test methods used to sample and analyze manure, litter, process wastewater, and soil, 3.) Results from manure, litter, process wastewater, and soil sampling and 4.) Total amount of nitrogen and phosphorus actually applied to each field, including documentation of calculations for the total amount applied.	Annually for manure samples, at least once every three years for soil samples	Both
Land	Manure application equipment inspections, including the following information, 1.) Date inspection conducted and 2.) Calibration date; and iii. Maintenance of equipment used for manure application.	At least annually	Both
Land & No-Land	Inspections, including date, of the storm water routing structures	Weekly	Both
Land & No-Land	Inspections, including date, for all indoor and outdoor water lines, including drinking or cooling water lines	Daily	Both
Land & No-Land	The depth of manure and process wastewater, including date of reading, as indicated by the depth marker in all liquid animal waste impoundments	Weekly	Liquid
Land & No-Land	Inspections, including date, of all wastewater operations and pumps	Weekly	Liquid
Land & No-Land	All manure, litter, and wastewater storage structures including the following information, 1.) Date inspection conducted, 2.) Volume for solids accumulation, 3.) Design treatment volume, 4.) Total design storage volume, 5.) Days of storage capacity and 6.) Structural stability inspection of all earthen embankment structures.	As necessary	Liquid
Land & No-Land	Any additional self – inspection and recordkeeping activities required by this General Permit	As necessary	Both

Self-Inspection and Recordkeeping for CAFOs/MAFOs that DO NOT Land Apply (No-Land Operations):

The permittee that transports all and/or some of its manure, litter, or process wastewater to an area that is not under the control of the owner or operator of the no-land operation shall maintain no-land operation records on-site for five years. The records shall be available for inspection by the Maryland Department of the Environment personnel upon request. The record shall also include a notation of periods when the facility is not in operation (out of production).
