## MARYLAND DEPARTMENT OF THE ENVIRONMENT

Land and Materials Administration • Resource Management Program  
1800 Washington Boulevard • Suite 610 • Baltimore Maryland 21230-1719  
410-537-3314 • 800-633-6101 x3314 • www.mde.maryland.gov

### NOTICE OF INTENT

General Discharge Permit for Animal Feeding Operations (AFOs) (19AF, MDG01)  
Land and Materials Administration – Resource Management Program  
Issued Pursuant to Title 9, Environment Article, *Annotated Code of Maryland*, and Code of  
Maryland Regulations (COMAR) 26.08.04

*Submission of this Notice of Intent (NOI) constitutes notice that the person identified in this form intends to operate under and comply with all terms and conditions of the State/NPDES General Discharge Permit for AFOs (AFO Permit). The discharge of animal waste, including manure, poultry litter, and process wastewater to waters of the State is prohibited unless an AFO has been registered under the AFO Permit by the Maryland Department of the Environment ("MDE"). A person shall hold a CAFO discharge permit issued by MDE before beginning construction on any part of a new CAFO.*

Please submit this completed NOI Form to the following address:

Maryland Department of the Environment  
Land and Materials Administration/AFO Division  
1800 Washington Boulevard, Suite 610  
Baltimore, Maryland 21230-1719

### General Information

AI Number: 134866

1. LEGAL Name of Applicant (must match name on required plan):

CAL-MANUE FOODS, INC

2. AFO Type (circle one): CAFO / MAFO

3. Applying for (check one):  
☒ New Coverage see column 'A' in Question 4  
☐ Continuation of Coverage (renewal) see column 'B' in Question 4  
☐ Modification of 19AF Coverage see column 'C' in Question 4

4. Reason for NOI (please fill out corresponding column):

| A. New Coverage   | B. Continuation of Coverage (renewal)  | C. Modification of 19AF Coverage   |
|---|--|--|
| <input checked="" type="checkbox"/> New owner/operator<br><input type="checkbox"/> Proposed operation (NO construction may begin until permit coverage is obtained)<br>• Date of anticipated start of AFO operation:<br>_____ | <input type="checkbox"/> No changes in operation<br><input type="checkbox"/> There has been a change in one or more of the following (please indicate): <ul style="list-style-type: none"><li>○ Size or number of houses</li><li>○ Animal number, resulting in change of size category</li><li>○ CAFO to MAFO, MAFO to CAFO</li><li>○ No-Land to Land, Land to No-Land</li><li>○ Conventional operation to Organic</li></ul> | <input type="checkbox"/> Expanding<br><input type="checkbox"/> Change in animal number, resulting in change of size category<br><input type="checkbox"/> Change from CAFO to MAFO<br><input type="checkbox"/> Change from MAFO to CAFO<br><input type="checkbox"/> Change from no-land to land<br><input type="checkbox"/> Change from land to no-land<br><input type="checkbox"/> Change from conventional to organic operation |

### Applicant (Owner/Operator Information)

5. Mailing Address of Applicant: 795 Woods Hill Rd  
 City: Warwick State: MA Zip Code: 21912

6. Telephone Number(s) of Applicant: Office  
 (Home) \_\_\_\_\_  
 (Cell) \_\_\_\_\_  
 (Cell) \_\_\_\_\_

7. Email of Applicant: \_\_\_\_\_

### Farm Information

Please attach a topographic map including the production area as well as the land application area (if applicable)

8. Farm Name: ☐ Same as Legal Name  
☒ Other (please specify): CAL MARINE Milington Layers

9. Farm Address: 33205 Walnut Tree Rd  
 City: Milington County: Kent Zip Code: 21651

10. Watershed/Hydrologic Unit Code (HUC) (12-digit): 02 130 5700 427

11. Latitude/Longitude of Production Area (Deg/Min/Sec): 39 - 17 - 6.5 / 75 - 48 - 32.6

#### 12. Animal Information:

| A. Animal Type(s)<br>(from AFO size chart) | B. Maximum Number of<br>Animals at any given time<br>(For poultry, please indicate bird<br>type and number per flock) | C. Operation Size<br>(consult AFO size<br>chart) | D. Animal Confinement<br>Type<br>(e.g. house, feedlot, barn,<br>milking parlor, pen) |

## Manure/Mortality Management

17. Total Manure/Litter/Wastewater generated annually: 13,327 circle one: (tons) lbs (gallons)  
1,099,000 Egg wash water
18. Total Manure/Litter/Wastewater transported offsite annually: 13,327 circle one: (tons) lbs (gallons)  
1,099,000 Egg wash water
19. \*\*Total number of acres controlled by applicant available for land application of manure/litter/process wastewater: Owned: 251 Leased: 251

\*\*40 CFR Parts 122.23(b)(3) and 412.2(e) define "land application area" as all land under the control of the AFO owner/operator, whether by ownership, lease, or agreement, to which manure, litter or process wastewater is or may be applied.

### 20. Manure Storage (please list individually):

| A. Type (e.g. shed, lagoon, pit) | B. Capacity (ft <sup>3</sup> , gal) | C. Solid/Liquid |
|----------------------------------|-------------------------------------|-----------------|
| Shed (4)                         | 270,400 ft <sup>3</sup>             | Solid           |
| Lagoon                           | 593,669                             | Liquid          |

### 21. Mortality Management Method:

- ☒ Compost
 ☐ Incinerate  
☐ Freeze
 ☐ Other (please specify): \_\_\_\_\_  
☐ Render

## Environmental Justice (EJ) Score

The EJ Score is an overall evaluation of an area's environment and existing environmental justice indicators including pollution burden exposure, pollution burden environmental effects, sensitive populations, and socioeconomic factors. Provide the EJ Score resulting from the use of a Maryland EJ tool for the census tract where an applicant is seeking a permit. The EJ Score can be generated using MDE's EJ Screening Tool at: <https://mdewin64.mde.state.md.us/EJ/>.

22. EJ Score:

67-12

## CAFOs Only - Fees

Once a completed NOI is received by MDE and processed, MDE will invoice the applicant for any permit fees owed pursuant to COMAR 26.08.04.09-1.

## Required Plan

CAFO permit application requirements at 40 CFR §122.21(i)(1)(x) specify that applications for coverage (including NOIs) must include nutrient management plans (NMPs) that at a minimum satisfy the requirements specified in 40 §122.42(e). Comprehensive Nutrient Management Plans (CNMPs), as defined in the General Discharge Permit for Animal Feeding Operations (AFOs) (19AF, MDG01), satisfy these requirements. An application will not be processed until a completed NOI form and a current CNMP are received. A CNMP must be developed by a certified and licensed plan writer, and in addition to the federal requirements, must satisfy the nutrient management requirements in COMAR 15.20.07 and 15.20.08.

## Certification

By signing this form, I the applicant or duly authorized representative, do solemnly affirm under the penalties of perjury that the contents of this application are true to the best of my knowledge, information, and belief. I hereby authorize the representatives of MDE to have access to the AFO and associated lots/facilities (farms) for inspection and to records relating to this application at any reasonable time. I acknowledge that depending on the type of permit applied for, other permits or approvals may be required. The personal information requested on this form is intended to be used in processing your NOI. This Notice is provided pursuant to Title 4 of the General Provisions Article, Annotated Code of Maryland. Your NOI may not be processed if you fail to provide all requested information. You have the right to inspect, amend, or correct this form. MDE is a public agency and subject to the Maryland Public Information Act (Md. Code Ann., Gen. Prov. §§ 4-101, et seq.). This form may be made available on the Internet via MDE's website and is subject to inspection or copying, in whole or in part, by the public and other governmental agencies, if not otherwise protected by federal or State law.

\*\*Concentrated Animal Feeding Operation (CAFO) or Maryland Animal Feeding Operation (MAFO) – provide the numbers below (if applicable)

AI Number: 22189 (Warwick); 134866 (Millington Laver); 130331 (Millington Pullet)

## CNMP Purpose and Agreement

The Comprehensive Nutrient Management Plan (CNMP) is an important part of the conservation management system (CMS) for your Animal Feeding Operation (AFO). This CNMP documents the planning decisions and operation and maintenance for the AFO.

This CNMP is valid as long as there are no major changes to the operation. A CNMP plan revision will be needed when the number of animals deviates by 10% from the planned amount or when the operation changes from one type of livestock to another. Nutrient management plan revisions will be needed based on Maryland Department of Agriculture Nutrient Management regulations.

This CNMP was developed paying special attention to the USEPA's required nine minimum practices for water quality protection. This plan when implemented by the farmer will ensure clean runoff is diverted from manure storage and production areas and livestock are prevented from making direct contact with waters.

### Owner/Operator

As the owner/operator of this CNMP, I, as the decision maker, have been involved in the planning process and agree that the items/practices listed in each element of the CNMP are needed. I understand that I am responsible for keeping all necessary records associated with implementation of this CNMP. It is my intention to implement/accomplish this CNMP in a timely manner as described in the plan.

- Resource Concerns Identification Worksheets

## Purpose of the Comprehensive Nutrient Management Plan (CNMP)

A Comprehensive Nutrient Management Plan (CNMP) is a conservation system that is unique to your animal feeding operation (AFO). This plan is a grouping of conservation practices and management activities which, when implemented as part of a conservation system, will help to ensure that both production and natural resource protection goals are achieved for your operation. A CNMP incorporates practices to utilize animal manure and organic by-products as a beneficial resource. Your CNMP addresses natural resource concerns dealing with soil erosion, manure, and organic by-products and their potential impacts on water quality, which may derive from an AFO. A CNMP is developed to assist an AFO owner/operator in meeting all applicable local, tribal, State, and Federal water quality goals or regulations. For nutrient impaired stream segments or water bodies, additional management activities or conservation practices may be required to meet local, tribal, State, or Federal water quality goals or regulations.

The conservation practices and management activities planned and implemented as part of a CNMP must meet NRCS technical standards. For those elements included by an owner and/or operator in a CNMP for which NRCS currently does not maintain technical standards (i.e., feed management, vector control, air quality), producers should meet criteria established by Land Grant Universities, industry, or other technically qualified entities. Within each state, the NRCS State Conservationist has the authority to approve non-NRCS criteria established for use in the planning and implementation of CNMP elements.

Nutrient management and waste utilization manage the source, rate, form, timing, placement, and utilization of manure, rather than disposing of it as a waste residual. The goal is to effectively and efficiently use nutrient resources derived from animal waste to adequately supply soils and plants to produce food, forage, fiber, and cover while minimizing environmental impacts.

### Minimum Standards of a CNMP

The Nine Minimum Standards to Protect Water Quality:

- 1. Ensure adequate storage capacity.** Design, construct, operate, and maintain the production area and all animal waste storage structures to contain all animal waste, including any runoff or direct precipitation from a 25-year, 24-hour storm. Need to store dry manure in a way that prevents polluted runoff. Properly operate and maintain all storage facilities.
- 2. Ensure proper management of mortalities to prevent the discharge of pollutants into waters of the State.** Do not dispose of mortalities in an animal waste or other storage or treatment system that is not specifically designed to treat animal mortalities without written permission from the Department, which may be granted if the Department determines catastrophic circumstances.
- 3. Divert clean water, as appropriate, from the production area to keep it separate from process wastewater.** For CAFOs, conduct daily inspections of all outdoor water lines, and those located inside buildings with grated floors, on all days the CAFO is in operation. Correct any deficiencies found as a result of the inspections as soon as possible, and maintain a log of deficiencies found and corrected. The

log must contain records of any deficiencies not corrected within 30 days and an explanation of the factors preventing immediate correction.

**4. Prevent direct contact of confined animals with waters of the State.**

**5. Chemical Handling.** Ensure that chemicals and other contaminants handled on-site are not disposed in any manure, litter, process wastewater, or storm water storage or treatment system unless specifically designed to treat such chemicals and other contaminants. No pesticides, cleaning agents, or fuels shall be stored in any animal operation area, unless directly necessary for animal care and public health. These products shall not be allowed to enter waters of the State. The permittee shall notify the Department of any spills or other discharges as detailed under Part V.F. "Noncompliance Notification."

**6. Conservation practices to control nutrient loss, including site-specific conservation practices.**

a. An AFO shall maintain a setback of 100 feet or a 35 foot vegetated filter strip between stored poultry litter and manure and waters of the State, as well as field ditches. For existing permanent storage structures, an alternative to this requirement is provided in paragraph IV.A.1.b.6 of this permit.

b. For a poultry CAFO, permit condition IV.B.1. applies to the storage of poultry litter manure. In addition, poultry manure stored for more than 14 calendar days in the field, where manure may be applied as nutrients for crop growth under a nutrient management plan, shall be separated from ground water and storm water to prevent leaching or runoff of pollutants through the use of both a plastic liner and cover, at least 6 mils thick, or an equivalent method approved by the NRCS (if a standard is adopted by NRCS that meets federal requirements for CAFOs and is approved by the Department).

c. For a poultry MAFO, MDA and NRCS requirements apply to the field storage of poultry litter manure. The following additional requirements for poultry litter manure field storage areas do not include authorization to discharge pollutants to surface waters of the State:

i) MAFO poultry litter manure stored for more than 30 calendar days in the field shall be separated from ground water and storm water to prevent leaching or runoff of pollutants

through the use of both a plastic liner and cover, at least 6 mils thick, or an equivalent method approved by the NRCS.

ii) If reputable research is performed, based on a plan approved by the Department and MDA, resulting in data that indicates that 30 calendar days is more restrictive than necessary to protect water quality, and/or other more effective approaches to controlling discharges from poultry manure stockpiles are recommended and available as a result of the study, the 30 calendar day requirement shall be automatically stayed and the permit reopened to implement appropriate permit revisions through a public process.

**7. Protocols for manure and soil testing.** Identify specific animal waste sample collection and analysis protocols to include at least annual analysis for phosphorus and nitrogen content. Include analysis of soil samples for pH and phosphorus content at least once every three years for all fields where animal waste may be applied. Protocols shall be consistent with Maryland's technical standards at COMAR 15.20.07 and 15.20.08.

**8. Protocols for the Land Application of Manure and Wastewater.** Follow protocols for development of a nutrient management plan and for the land application of animal waste in COMAR 15.20.07 and 15.20.08, which specify who is eligible to develop a NMP, determination of limiting nutrient, nutrient recommendations, acreage, and expected yield for each field. Animal waste shall not be applied at a rate higher than agronomic requirements in accordance with the Maryland Nutrient Management Manual. Animal waste shall be prevented from entering field ditches, adjacent properties, and other waters of the State, or conduits to waters of the State, except floodplains. In addition, the following requirements for setbacks shall be maintained:

a. A setback of at least 100 feet from waters of the State, as well as field ditches, other conduits, intermittent streams, and drinking water wells, shall be maintained; or an approved alternative may be substituted for the 100 foot setback.

b. A setback of at least 100 feet from property lines shall be maintained, unless an approved alternative setback for property lines is established with the consent of the adjacent property owner.

**c. Alternative Setback Requirements Applicable to Poultry MAFOs.** For slopes of 2% or less, a MAFO may satisfy the land application setback and buffer requirements of this permit by maintaining 1) a vegetated filter strip at least ten feet wide along field ditches and in the final 35 feet of the field ditches (applicable to ditch embankments and, to the maximum extent practicable, the channel) adjoining the receiving waters or the operation boundary, whichever occurs first, and 2) a 35 foot vegetated filter strip or a 50 foot setback from all other surface waters of the State, as defined in Part II.JJ.1. In Critical Areas, other alternative setbacks may be required by the Department.

**9. Record Keeping.** Maintain all records necessary to document the development and implementation of the NMP and Conservation Plan and all other requirements of Parts IV and V of this permit. These records shall be maintained for five years.

The nutrient management plan, contained in this CNMP, will be updated before the expiration date. The NM plan will need revised on or before the expiration date. Any substantial changes, before this expiration date will need to be documented and revisions made by a certified consultant. A copy of this revision must be kept with your nutrient management records.

A Nutrient Management Annual Implementation Report must be submitted, each year, to the Maryland Department of Agriculture on or before March 1<sup>st</sup>.

Nutrient Management Plan Narrative:

Cal-Maine Foods purchased ISE America in 2024. The farm operation continues to be an integrated egg laying and production operation. The operation has nearly 2.5 million layers in the state of Maryland plus additional pullets, for future replacement flocks, as well as their own feed mill and shell egg processing plants.

The facilities are world-class, matching the state of the art for the industry. All hens are in environmentally controlled houses, directly set up for "in line" processing, from the laying house to the MOBA or Diamond egg grading equipment.

At each of the processing locations, eggs are reviewed by Cal-Maine personnel and by the automatic machines equipped with crack, dirt, and blood detectors.

Every egg is washed, sanitized, weighed, processed and packed within hours from the time of lay. And every facility is state of the art and monitored by full time USDA resident inspectors.

Founded in 1957 and headquartered in Ridgeland, Mississippi; Cal-Maine Foods, Inc. is the largest producer and distributor of fresh shell eggs in North America.

## **In Case of an Emergency Storage Facility Spill, Leak, or Failure:**

**Implement the following first containment steps and where containment material is located:**

This plan will be implemented in the event that animal by-products from your operation are leaking, overflowing, running off site or there is imminent danger that such may occur from damage or failure of the system or a threatening natural occurrence, such as a hurricane. You should not wait until manure reaches surface waters or leaves your property to consider that you have a problem. You should make every effort to ensure that this does not happen. This plan should be posted in an accessible location for all employees at the facility. The following are some action items you should take in the event of an emergency:

### **Action Plan**

**In case of an emergency; including a spill, leak, or failure:**

#### **Spills from containment areas or structure failures:**

1. Stop all other activities to address the problem;
2. Call for assistance, if needed;
3. Construct sand bag or earthen dike to contain or divert spills away from surface inlets, roadways, and surface water features. Add absorbent material such as pads, sawdust, straw or dry soil as needed for containment.
4. Remove spill from diked area with appropriate equipment such as: vacuum tank, front-end loader and spreader, or other method as directed by local or state authorities.
5. Complete the clean-up and repair the necessary components.
6. Initiate additional containment measures, corrective measures, or property restoration measures as directed by emergency agency officials.

#### **Spills during pumping operations:**

1. Shut off all pumping equipment.
2. Build a sand bag or earthen dike.
3. Remove spill from diked area with appropriate equipment such as: vacuum tank, front-end loader and spreader, or other method as directed by local or state authorities.
4. If the spill was due to a structural failure, contact the local NRCS office immediately for repair recommendations.

#### **Spills during transportation on public roadways:**

1. Coordinate efforts with local law enforcement and emergency personnel.
2. Contain spill and divert waste away from watercourses;
3. Call for additional assistance, equipment, and supplies, as appropriate;
4. Remove spill with appropriate equipment such as: vacuum tank, front-end loader and spreader, or other method as directed by local or state authorities.

**Spill area clean up:**

1. Break down dike.
2. Dry out sand bags.
3. Properly discard any absorbent pads used.
4. Level any soil disturbance and incorporate residue.
5. Re-vegetate disturbed area.

## In Case of an Emergency Land Application Manure/Waste Discharge

### CNMP EMERGENCY RESPONSE (CONT.)

If manure is spilled directly into waters of the state, it can create an environmental or public health hazard. Contact MDE as soon as possible within 24 hours after a spill.

Provide the following information:

1. Name and identification of the farm;
2. A description of the discharge and cause, including a description of the flow path to the receiving waters, and an estimate of the volume discharged;
3. Any obvious damage, such as a fish kill or property damage;
4. The period of discharge, including exact dates and times, and, if not corrected, the anticipated time the discharge is expected to continue;
5. Describe the steps being taken to reduce, eliminate, and prevent recurrence of the discharge.

#### **Threatening Natural Occurrences**

Prevent or minimize damage caused by threatening natural occurrences, such as hurricanes or strong storms associated with approaching fronts - actions include:

1. Do not spread manure on fields just prior to an approaching storm.
2. Do not spread manure on fields that flood during high rainfall events.
3. Notify State Veterinary Office - Animal Emergency Response Coordinator (See Table below) or Local Animal Emergency Response Coordinator for relocation of animals if needed.

#### **Personal injury**

1. Stop all other activities to deal with the emergency.
2. Call for help (See Emergency Contact Information).

#### **Catastrophic deaths -- Disease Related**

1. Notify State Veterinary Office.
2. Limit exposure to other animals.
3. Prevent visitation by unnecessary people.
4. Dead animals should be moved into a DHEC approved transport vehicle or a DHEC approved storage area or bin.
5. Record date of catastrophic deaths, number of deaths, method and location of disposal.

#### **Catastrophic deaths -- Disaster Related**

1. Notify State Veterinary Office - Animal Emergency Response Coordinator immediately. (See Emergency Contact Information)
2. Remove mortality from the barns/houses.
3. Dispose of mortality in the manner given in this CNMP for emergency dead animal disposal.
4. Record date of catastrophic deaths, number of deaths, method and location of disposal.

**Manure Removal**

1. Place manure in stacking structure if available. Do not stack old manure next to new or wet manure next to dry.
2. Records should be kept for any manure which is transported off the farm site.

**Fire**

1. Stop all other activities to deal with the emergency.
2. Try to extinguish the fire with the appropriate rated fire extinguishers.
3. If fire cannot be contained, call for help (See Emergency Contact Information)

## In Case of an Emergency Land Application Manure/Waste Discharge

**Assess the extent of the spill and note any obvious damages**

1. Did the by-product reach any surface waters?
2. Approximately how much was released and for what duration?
3. Any damage noted, such as employee injury, fish kills, or property damage?
4. Did the spill leave the property?
5. Did the spill have the potential to reach surface waters?
6. Could a future rain event cause the spill to reach surface waters?
7. Are potable water wells in danger (either on or off of the property)?
8. How much reached surface waters?

**Provide the following information when reporting an emergency**

1. Your name and phone number.
2. Directions to the farm.
3. Description of emergency.
4. Estimate of the amounts, area covered, and distance traveled.
5. Has manure reached surface waters or major field drains?
6. Is there any obvious damage: employee injury, fish kill, or property damage?
7. What activities are currently in progress to contain situation?

Implement procedures as advised by MD NRCS and technical assistance agencies to rectify the damage, repair the system, and reassess the manure management plan to keep problems with release of manure from happening again.

### **Documentation**

The following items shall be documented in writing and filed with your farm operation records for future reference and emergency response training:

1. Date and time, location of spill, affected landowners.
2. Affect of manure spill on any surface water body or potable water well.
3. Approximately how much manure was released and for what duration.
4. Amount of manure, if any, which left the farm property.
5. Any damage, such as personal injury, fish kill, property damage.
6. Cause of the spill.
7. Procedure to handle the emergency.
8. Clean up efforts.
9. List of authorities called, those that responded, and the time it took for them to respond.
10. Recommendations to prevent a reoccurrence.

## **In Case of an Emergency Land Application Manure/Waste Discharge**

**Implement the following first containment steps and where containment material is located:**

1. Stop all other activities to deal with the emergency.
2. Stop manure pumps and irrigation equipment. Close valves. Separate pipes to create air gap if necessary to stop manure flow.
3. Assess the extent of the emergency and determine how much help is needed.
4. Call for help if needed.
5. If spilled on the road, call the sheriff's office for traffic control and clean the spill immediately from the road and roadside if needed.
6. Contain the spill or runoff from entering the stream or waterway using straw bales, saw dust, or soil material.
7. Prevent further runoff by incorporating the waste.
8. Initiate additional containment measures, corrective measures, or property restoration measures as directed by emergency agency officials.

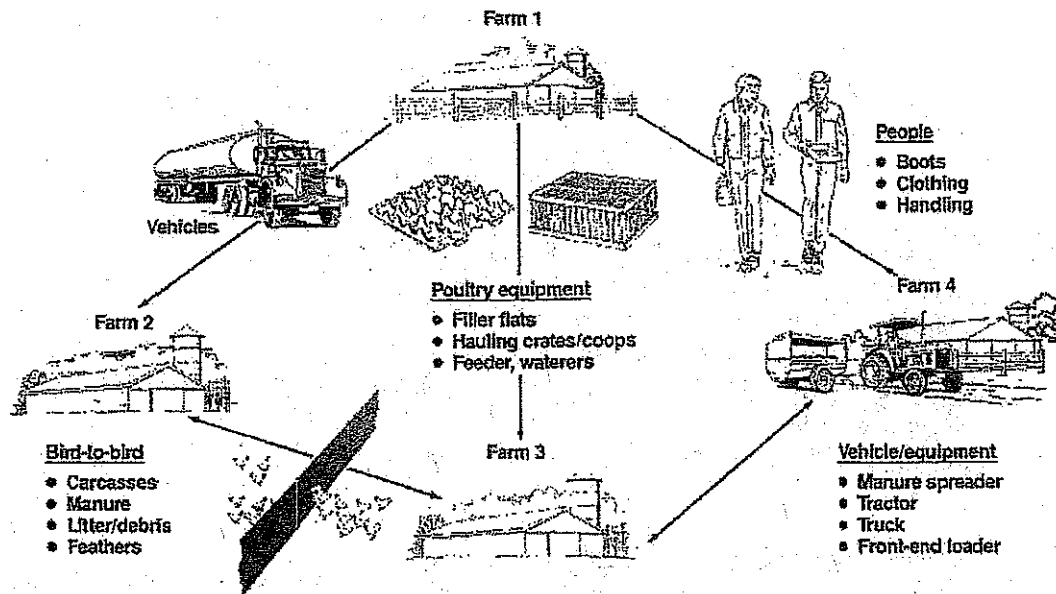

**Follow the above guidelines for:**

- **Assessing the extent of the spill and noting obvious damages**
- **Provide information when reporting the emergency**
- **Documentation of your farm operation records**

### **Biosecurity**

Biosecurity means doing everything possible to protect the health of livestock by preventing the transmission of disease. An outbreak of animal disease could not only harm your livestock, it could effect other nearby animals and quickly spread through your area. The economic consequences of a disease outbreak could be devastating. Taking common sense precautions to prevent disease from coming onto your farm is the best investment you can make.

## How Diseases Spread (Example – Poultry Operation)

### Steps to Take to Avoid Disease Spread

To reduce the risk of introducing disease entering into an animal feeding operation, maintain a biosecurity barrier (physical barrier, personal hygiene, and equipment sanitation) between wildlife, animals, animal containment areas, and other commercial facilities. Some examples of good biosecurity practices include:

1. Permit only essential workers and vehicles on the premises.
2. Give Germs the Boot
  - a. Keep a pair of shoes or boots to wear only around your animals.
  - b. Clean and disinfect your shoes often.
  - c. Always ask visitors and employees to clean their boots and shoes.
3. Don't Haul Home Disease
  - a. Always clean and disinfect vehicles used for moving animals.
  - b. Limit traffic of incoming people, products and vehicles that could bring in a disease.
  - c. Clean and disinfect all equipment that comes in contact with your animals.
4. Keep Your Farm Secure
  - a. Restrict access to your property and animals.
  - b. Keep doors and gates locked.

- c. Have tracking records on animals.
- 
- 5. Give Germs Space – Newly acquired animals should be isolated for at least two weeks to ensure you don't introduce disease to your main herd or flock. As an added protection, isolate and quarantine new animals for 30 days before putting them with your other animals. Keep show animals segregated for at least two weeks after they've been to a fair or exhibit.
  - 6. Look for Signs
    - a. Unusual animal health symptoms or behavior
    - b. Sudden, unexplained death loss in the herd or flock
    - c. Severe illness affecting a high percentage of animals
    - d. Blisters around an animal's mouth, nose, teats or hooves
    - e. Staggering, falling or central nervous system disorders that prevent animals from rising or walking normally.
    - f. Large number of dead insects, rodents or wildlife
  - 7. Don't Wait – Call in Signs of Disease Immediately  
Do not self-diagnose. Seek veterinary services, as early detection is your best protection. If you have animals with signs of suspect disease, call your local veterinarian, extension agent or the state veterinarian. Rapid response and investigation are the only ways to control and eliminate disease and stop large numbers of casualties or damage to our economic system.

## In Case of a Chemical Handling Emergency

### **Chemical Handling**

This section contains information on using pesticides safely, emergency contact information, spill information and the proper disposal of pesticide containers. For further information, please contact the Maryland Department of Agriculture Pesticide Regulation Program.

#### **USE PESTICIDES SAFELY**

1. Check the label - Be sure the pest you need to control is listed on the label.
2. Buy only enough pesticide for one or, at most, two years. Pesticides stored longer may degrade and become less active.
3. Always wear long trousers, a long-sleeved shirt, socks, and shoes when applying any pesticide. Other protective equipment, such as a respirator, goggles, impermeable gloves and boots maybe necessary or desirable for extra protection.
4. Do not wear leather shoes, boots, or gloves while handling pesticides. Leather absorbs pesticides and cannot be decontaminated easily.
5. Take care to avoid pesticides coming into contact with your eyes, mouth, or skin.
6. Wash your hands with soap and water immediately after applying a pesticide. Shower as soon as possible.
7. Stand upwind while mixing and applying pesticides.
8. Unless the label specifically allows such use, never apply a pesticide where it could contact water sources, and avoid applying to bare ground.
9. Never apply a pesticide at a higher rate than the label directs.
10. Wash all clothing worn during mixing and application separately from household laundry. Use a heavy duty detergent and hot water. Dry the clothes in a hot dryer or outside in the sun.
11. Store pesticides only in their original containers. Keep them away from food, feed, seed, and fertilizers in a locked building or cabinet.
12. Dispose of empty pesticide containers in accordance with label directions and state and local requirements. See Disposal of Pesticide Containers

#### **DISPOSAL OF PESTICIDE CONTAINERS**

Pesticides (herbicides, insecticides, fungicides, etc.) are designed to be toxic. Improper disposal of pesticides or their containers can lead to environmental contamination and may incur both civil and criminal penalties. There is usually no safe and legal way to dispose of leftover pesticide; all of the chemical must be used up on registered sites or crops according to directions on the label. The Environmental Protection Agency (EPA) has accepted certain procedures, outlined below, which are designed to remove as much residue from the container as possible. Only after following these procedures may pesticide containers be deposited in a licensed sanitary landfill.

#### Containers of Liquid Formulations

1. Triple rinse the container immediately after emptying it into the spray tank:

Fill the container 1/4 full with the proper diluent (usually water or oil). Replace the closure or plug the opening. Rotate the container. Add rinsate to the spray tank. Repeat this procedure 2 more times

2. Puncture the top and bottom of the container to prevent its reuse.

3. Deposit the empty container in a licensed sanitary landfill.

#### Containers of Dry Formulations

1. Empty the contents into the tank, shaking the container to remove as much residue as possible. Take care not to inhale any dust.

2. Open both ends of the container to help remove residue and to prevent reuse.

3. Deposit the empty container in a licensed sanitary landfill.

If checked, the indicated measures will be taken to prevent chemicals and other contaminants from contaminating process waste water or storm water storage and treatment systems.

| <input checked="" type="checkbox"/> | Measure   |
|-------------------------------------|---|
|                                     | All chemicals are stored in proper containers. Expired chemicals and empty containers are properly disposed of in accordance with state and federal regulations. Pesticides and associated refuse are disposed of in accordance with the FIFRA label. |
|                                     | Chemical storage areas are self-contained with no drains or other pathways that will allow spilled chemicals to exit the storage area.  |
|                                     | Chemical storage areas are covered to prevent chemical contact with rain or snow.   |
|                                     | Emergency procedures and equipment are in place to contain and clean up chemical spills.  |
|                                     | Chemical handling and equipment wash areas are designed and constructed to prevent contamination of surface waters and waste water and storm water storage and treatment systems.   |
| <input checked="" type="checkbox"/> | All chemicals are custom applied and no chemicals are stored at the operation. Equipment wash areas are designed and constructed to prevent contamination of surface waters and waste water and storm water storage and treatment systems.            |

**EMERGENCY CONTACTS:**

For individuals exposed to chemicals the following are the telephone numbers for emergency treatment centers and the telephone number for the nearest poison control center.

1. Maryland Poison Control Center 1-800-222-1222
2. Maryland Department of Agriculture (Pesticide Section), 410-841-2721
3. Delaware Department of Agriculture (Pesticide Section), 302-698-4570
4. CHEMTREC Emergency Hotline, 1-800-424-9300
5. Local Police/Fire 911
6. National Pesticide Information Center (NPIC), 1-800-858-7387, Monday - Friday, 6:30 a.m. to 4:30 p.m. Pacific Time

**EMERGENCY SPILLS:**

1. Fires, spills or other incidents of pesticide release to the environment must be reported immediately to the Maryland Department of the Environment (MDE), Emergency Response at: 1-866-633-4686 or 1-866-MDE-GOTO (24 hours a day, 7 days a week)
2. Fires, spills or other incidents of pesticide release to the environment can also be reported immediately to the State of Maryland Department of Agriculture: 1-410-841-5710 or 1-800-492-5590 (8:00 AM to 4:30 PM - Monday through Friday)
3. The 24-hour CHEMTRAC telephone number for emergency assistance is: 1-800-424-9300

### **Animal Mortality Disposal**

Animals die because of disease, injury, or other causes in any confined livestock operation. The mortality rate is generally highest for newborn animals because of their vulnerability.

Catastrophic mortality can occur if an epidemic infects and destroys a large portion of the herd or flock in a short time, or if a natural disaster, such as a flood or excessive heat strikes. There are also incidences when an entire herd or flock must be destroyed to protect human health or other farms in the area.

The purpose of this CNMP is to present options to manage normal, day-to-day mortalities and even catastrophic mortalities should this occur. Planning for a catastrophic mortality event should include the study of appropriate regulations, locating a site for disposal, and having insurance to cover the cost involved.

### **Mortality Management Methods**

Mortality must be managed for at least three reasons:

1. Hygiene
2. Environmental protection
3. Aesthetics

Acceptable ways for managing mortality include:

1. Rendering
2. Composting
3. Incineration
4. Sanitary landfills
5. Burial
6. Disposal pits

Of these methods, only the rendering and composting methods recycle the nutrients. The other methods, in essence, waste the nutrients.

This farm operation will use composting for normal mortality and composting for catastrophic mortality. See below:

### **Composting – Poultry**

Composting is the controlled aerobic biological decomposition of organic matter into a stable, humus-like product, called compost. Decomposition is enhanced and accelerated by mixing organic waste with other ingredients in a manner that optimizes microbial growth. Composting mortality can be likened to aboveground burial in a biomass filter where most of the pathogens are killed by high temperatures.

As the microbial population consumes the most readily degradable material and grows in numbers, the temperature of the compost pile begins to rise. Efficient composting requires that the initial compost mix have:

A balance source of energy (carbon) and nutrients (primarily nitrogen), typically with a carbon-to-nitrogen (C:N) ratio of 15:1 to 35:1.  
Sufficient moisture, typically 40% to 60%.

- Sufficient oxygen for an aerobic environment.
- A pH in the range of 6 to 8.

For proper composting, correct proportions of carbon, nitrogen, moisture, and oxygen need to be present in the mix. Common carbon sources are sawdust or wheat straw. It is desirable because of its bulking ability, which allows entry of oxygen. Other carbon sources that could be used are peanut hulls, cottonseed hulls, sawdust, leaves, etc. If lab testing of the litter or experience indicates that the carbon/nitrogen ratio is adequate (20 - 35:1 ratio), then litter alone should be sufficient for composting mortality as long as desirable bulking ability is achieved and moisture is properly managed. Moisture management is critical and must be maintained between 40 and 55 percent (40% - does not leave your hand moist when squeezed, 55% - if more than two drops drip from your hand the material is too moist).

#### Recipe for composting broiler mortality

| INGREDIENT | VOLUME | WEIGHTS |
|------------|--------|---------|
| Straw      | 1.0    | 0.10    |
| Carcasses  | 1.0    | 1.0     |
| Litter     | 1.5    | 1.2     |
| Water      | 0.5    | 0.75    |

#### Compost process

The first layer is one foot of litter.

A 4-6 inch layer of carbon amendment (sawdust is preferred) is added according to the recipe

A layer of carcasses is added. Carcasses shall be laid side-by-side and shall not be stacked on top of one another. Carcasses placed directly on dirt or concrete floors, or against bin walls will not compost properly.

Water is added (uniform spray).

Carcasses are covered with a 6-inch layer of litter.

Next layer of carcasses begun with carbon amendment and above steps repeated.

When compost is full, cap the 6-inch layer with four additional inches.

Maintain the moisture content at 40 to 55 percent during the composting process (40% - does not leave your hand moist when squeezed, 55% will allow about one drop of water to be released when squeezed, > 55% - if more than two drops drip from your hand the material is too moist, therefore add sawdust or dry carbon source).

Temperature is the primary indicator to determine if the composting process is working properly. A minimum temperature of 130° F shall be reached during the composting process. A temperature of 140° F is optimum; however, temperatures may range up to 160° F. If the minimum temperature is not reached, the resulting compost shall be incorporated immediately after land application or recomposted by turning and adding moisture as needed. Compost managed at the required temperatures will favor destruction of any pathogens and weed seeds.

Good carcass compost should heat up to the 140° range within a few days. Failure of the compost material to heat up properly normally results from two causes. First, the nitrogen source is inadequate (example wet or leached litter). A pound of commercial fertilizer spread over a carcass layer will usually solve this problem. Secondly, the compost fails when too much water has been added and the compost pile becomes anaerobic. An anaerobic compost bin is characterized by temperatures less than 120°, offensive odors, and black oozy compound flowing from the bottom of the compost bin. In this case a drier bulking / carbon amendment should be added to dry the mix. Then, the material should be remixed and composted.

It is possible, though unlikely, for the temperature to rise above the normal range and create conditions suitable for spontaneous combustion. If temperature rises above 170° F, the material should be removed from the bin and cooled, spread on the ground to a depth not to exceed six inches in an area away from buildings. Water should be added only if flames occur. If temperature falls significantly during the composting period and odors develop, or if material does not reach operating temperature, investigate piles for moisture content, porosity, and thoroughness of mixing.

After this first stage process, the material should be turned into a second bin and allowed to go through a second heat process. For larger birds, especially turkeys, a third turning may be necessary for complete degradation of the birds. Typically, the process can be considered "done" within 21-28 days from the time the compost is filled for broilers. For turkeys, the process usually requires about 60 days. After the heat process, curing period of one to three months is usually required before the material is stable. Compost may be land applied after the secondary or tertiary composting. If any animal parts are still in the mix, the material must be incorporated. If immediate application is not possible the material should be stored using the same requirements as that of stored litter in the Stacking Shed O&M statement.

Inspect compost structure at least twice annually when the structure is empty. Replace any broken or badly worn parts or hardware. Patch concrete floors and curbs as necessary to assure water tightness. Examine roof structures for structural integrity and leaks. Inspections shall be documented on the attached worksheet.

The primary and secondary composters and the litter storage area should be protected from outside sources of water such as rain or surface runoff.

In order to assure desired operation of the composting facility, daily records should be kept during the first several compost batches. This can be helpful in identifying certain problems that may occur.

### **Operation and Maintenance**

This section addresses the operation and maintenance of the manure management system, conservation practices, soil testing, manure/compost testing, and equipment calibration.

Operation and maintenance of structural, non-structural, and land treatment measures requires effort and expenditures throughout the life of the practice to maintain safe conditions and assure proper functioning. Operation includes the administration, management, and performance of non-maintenance actions needed to keep a completed practice safe and functioning as planned. Maintenance includes work to prevent deterioration of practices, repairing damage, or replacement of the practice if one or more components fail. Listed below is the operation and maintenance for the structural, non-structural, and land treatment measures for your farm system.

### **Item Specific Operation and Maintenance**

Any specific items will be addressed in the Waste Management and O&M Plan for the Waste Storage Facility.

### **Vector Control and Abatement**

Management and sanitation are the real keys to preventing or eliminating any vectors' problems. If these weaknesses are not addressed, the problems will recur. Pesticides are the final tools in controlling the problem.

Most problems with insects (such as flies), rodents (such as rats and mice) and scavenging animals, (such as dogs, cats, foxes, possums, raccoons, etc.) can be minimized by keeping the facility and surroundings clean and properly maintained. This includes:

- Removing all excess building materials.
- Removal of any excess feed from the houses or around bins.
- Keeping grass and weeds mowed
- Keeping all buildings free of trash and debris.
- The proper use and servicing of bait stations.
- Proper and timely disposal of dead animals.
- Keeping all manure cleaned up caused by spillage from around the houses. Keep all temporary stored manure covered and dry.
- Any spillage of feed should be cleaned as soon as possible and all feed will be kept dry. Covers on feed storage bins should be used. Drainage away from all feed storage containers should be provided to reduce moisture accumulation.

#### **Actions to be taken for the abatement of an insect problem:**

- Mow vegetation around facility.
- Clean up any spilled feed.
- Repair or replace equipment that is spilling feed.
- Use covers to prevent feed from getting wet.
- Dispose of any wet or contaminated feed.
- Check for leaks from waterers, etc. and repair as needed.
- Remove any garbage or trash from the facility.
- Remove and dispose of all dead animals immediately and appropriately.
- Use approved baits, poisons, etc. as appropriate.

#### **Actions to be taken for the abatement of a rodent problem:**

- Mow vegetation around facility.
- Clean up any spilled feed.
- Repair or replace equipment that is spilling feed.
- Use covers to prevent feed from getting wet.
- Dispose of any wet or contaminated feed.
- Remove all excess building materials.

- Remove any garbage or trash from the facility.
- Check for damage or leaks from waterers, etc. and repair as needed.
- Remove and dispose of all dead animals immediately and appropriately.
- Use approved baits, poisons, etc. as appropriate.

Actions to be taken for the abatement of scavenging animal problems:

- Remove and dispose of all dead animals immediately and appropriately.
- Mow vegetation around facility
- Clean up any spilled feed.
- Repair or replace equipment that is spilling feed.
- Use covers to prevent feed from getting wet.
- Dispose of any wet or contaminated feed.
- Remove all excess building materials.
- Remove any garbage or trash from the facility.
- Check for digging activities that could damage or weaken buildings and repair as needed.
- Contact the proper officials for additional control measures.

For more details on specifics (rats, filth flies, etc.) information may be obtained from the Maryland Agricultural Extension Offices or the NRCS office.

### **Air Quality**

NRCS does not have specific technical criteria for these considerations that are required for CNMPs. However, the following items may be considered when addressing Air Quality, most Air Quality issues are associated with odor.

Air quality in and around structures, waste storage areas, and treatment sites may be impaired by excessive dust, gaseous emissions such as ammonia, and odors. Poor air quality may impact the health of workers, animals, and persons living in the surrounding areas. Ammonia emissions from animal operations may be deposited to surface waters, increasing the nutrient load to these regions. Proper siting of structures and waste storage facilities can enhance dispersion and dilution of odorous gases. Enclosing waste storage or treatment facilities can reduce gaseous emissions from AFO in areas with residential development in the region.

For an odor to be detected downwind, odorous compounds must be (a) formed, (b) released to the atmosphere, and (c) transported to the receptor site. These three steps provide the basis for most odor control. If any one of the steps is inhibited, the odor will diminish.

#### **A. Growing and Storage Facilities**

Odor problems can be prevented or reduced through adequate drainage, runoff management, proper care to keep animals and animal facilities clean and dry, and appropriate animal by-product removal, handling, and transport.

Locate animal by-product management facilities and utilization areas as far as practical from neighboring residences, recreational areas, or other conflicting land uses. Avoid sites where radical shifts in air movement occur between day and night, such as those near large bodies of water or steep topography. A component's location in relation to surrounding topography may also strongly influence

the transfer of odor because of daily changes in temperature and resulting airflow. To provide optimum conditions, prevailing winds should carry odors away from nearby residences.

Providing conditions or design features that alter the microclimate around specific components can further mitigate odor. An abundance of sunlight and good ventilation helps keep livestock and poultry areas dry and relatively odor free. Southern exposure with adequate slope to provide drainage for runoff is a preferred condition. Keeping animal by-products aerated and at appropriate moisture and temperature levels slows the development of anaerobic conditions and reduces odor.

#### B. Mitigation of Odor

Odor-causing substances from animal by-products are frequently attracted to dust particles in the air. Collecting or limiting the transport of dust aids in reducing odor. Vegetation is very effective in trapping dust particles. For example, pine trees planted downwind trap odor-laden dust particles and can provide a visual barrier to the animal operation. In addition, vegetation, landform, and structures can channel wind to carry odors away from nearby residences.

Chemical additives for the control or reduction of odors may be added to the bedding in the house or during removal.

#### C. To reduce Odor Problems during Spreading

1. Avoid spreading when wind will blow towards populated areas.
2. Avoid spreading just before weekends and holidays when people are more likely to be outdoors.
3. Spread in the morning when the air is warming and rising, rather than in the afternoon.
4. Animal waste applied to the soil surface should be incorporated within 24 hours of application to reduce odor, minimize surface runoff and maximize nutrient availability to the subsequent crop. Optimum incorporation time is 12 hours.
5. Injection of animal wastes beneath the soil surface is the preferred method of application.

#### D. Safety

1. Fencing should be provided to prevent livestock and people from entering the agriculture waste facility.
2. All waste storage structures must be posted with a "caution" sign Example- **DANGER - KEEP OUT**. If you do not have a sign, one can be provided.
3. Manure produces gases - caution should be taken so as not to be overcome by such gases \*(Gas masks are not adequate protection).

#### E. Structure Maintenance\*

1. Check backfill areas around structure (concrete, steel, timber, etc) often for excessive settlement. Determine if the settlement is caused by backfill consolidation, piping, or failure of the structure walls or floor. Necessary repairs must be made. Refer to safety items Part A above.
2. Check walls and floors often - minimum of 2 times a year when facility is empty - for cracks and/or separations. Make needed repairs immediately. Refer to safety items Part A above.
3. Outlets of foundations and sub-drains should be checked frequently and kept open. The outflow from these drains should be checked when the facility is being used to determine if there is leakage from the storage structure into these drains. Leakage may be detected by the color and smell of the out-flowing liquid, by lush dark-green growth of vegetation around the

outlet, by the growth of algae in the surface ditch, or by the vegetation being killed by the out-flowing liquid. If leakage is detected, repairs should be planned and made to prevent the possible contamination of groundwater. Refer to safety items Part A above, when planning and making repairs.

4. To prevent erosion, a good vegetative cover should be established and maintained on berms and embankments. Plantings should be clipped 3 times a year to kill noxious weeds and encourage vigorous growth. If the vegetative is damaged, berms and embankments will need to be re-vegetated as soon as possible.
5. Fences should be inspected and maintained in order to exclude livestock from the berms and embankments and to exclude unauthorized entry by people.
6. Check the channels and berms of the clean water diversions around the barnyard, buildings and storage structure frequently. Channels must be protected from erosion and berms must be maintained at the proper height to ensure adequate capacity. These channels and berms should not be used as haul roads unless they are designed and constructed for this purpose.
7. Check frequently for burrowing animals around buildings, structures, and in the berms and embankments. Remove them when they are found and repair any damage.
8. Inspect haul roads and approaches to and from the storage facility frequently to determine the need for stone, gravel or other stabilizing material.
9. Do not allow runoff from loading areas and from spills to flow into streams or road ditches.
10. Examine and repair all warning and hazard signs as needed.
11. Install and maintain a marking gauge post, which clearly shows the design levels of one-half and full for manure storage pits, ponds, and lagoons.
12. Clear blockages from roof gutters and outlets as needed.
13. Landowner should notify the Soil Conservation District of any major problems or repairs needed.
14. Roof of feed area must be maintained and operate as intended for the life of the practice (15 years). The function of the roof is critical since the manure storage facility is sized accordingly.

#### F. Miscellaneous

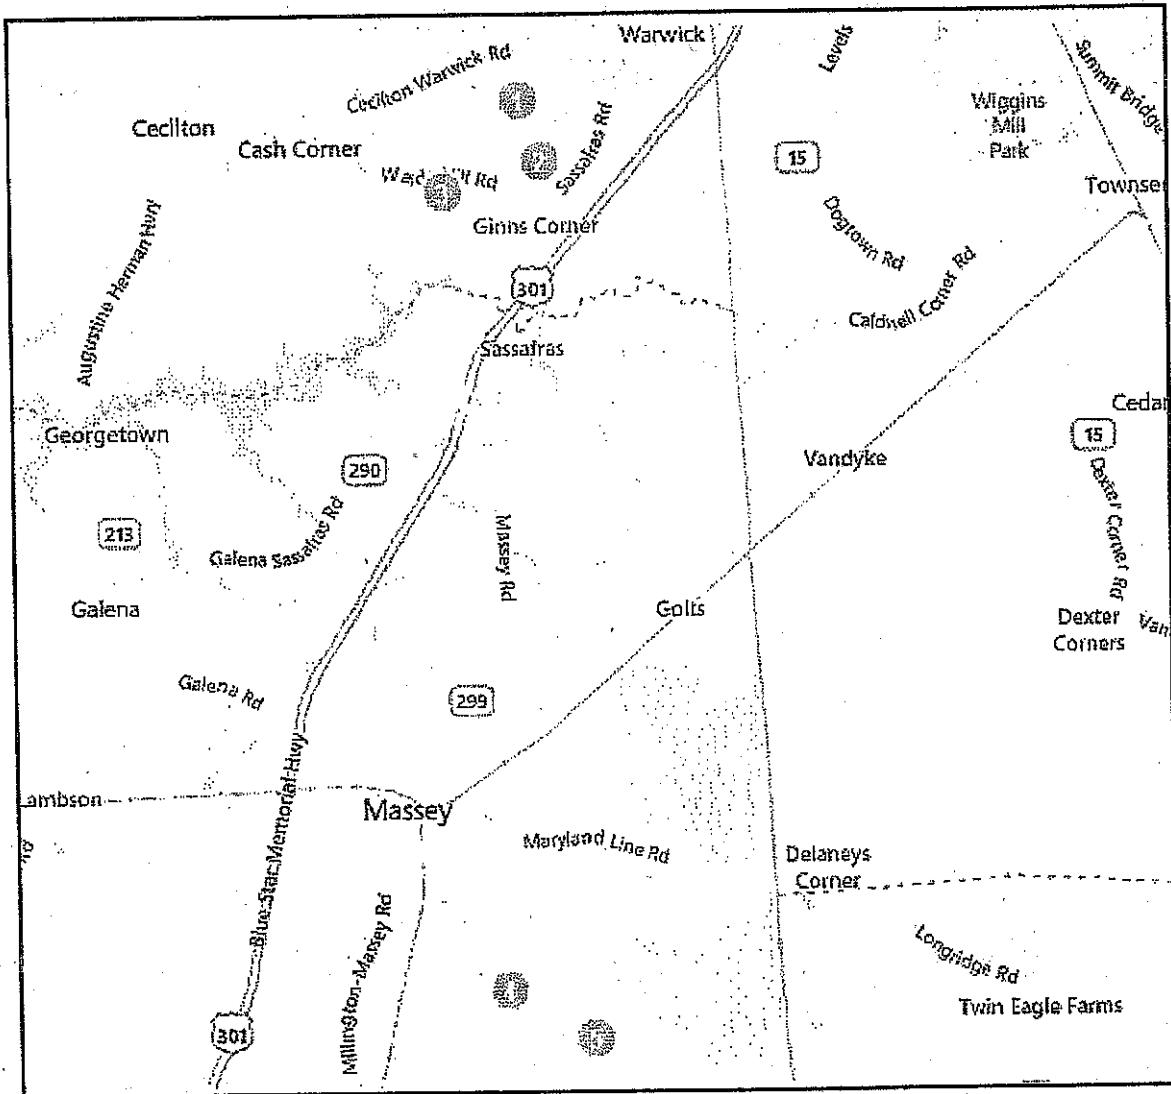

1. A Soil Conservation District representative will make an annual inspection.
2. Owner/operator fully understands that cost-share agencies can ask for a refund of money received, if an operation and maintenance plan is not followed by the owner/operator.

\* 2007 Delmarva Poultry Litter Production Estimates, George W. Malone, University of Delaware, Georgetown Delaware.

**Quantity of Poultry Litter, Cake/Crust Available per Year**

[illegible]

\*\*\* Cake/Crust not removed due to windrowing, is added with the litter remaining in the house the following year. Windrowing may likely result in actual quantities of litter being less than the estimates shown here. The actual amount of Cake/Crust removed may also be less than the estimated amounts produced due to improved drinker systems, ventilation, etc.

### Description of nearby Water Bodies

The farmstead and production area sits within the Sassafras River Watershed. The associated waterbody is Duffy Creek. All production areas, manure storage, manure cleanup - heavy use areas, and mortality management is at a minimum of 500' from any Public Drainage Ditches (PDAs) and/or Streams, Creeks, or Rivers. The farm operation is NOT in a Tier II Watershed.

| Farm Name     | Name of nearest Waterbody | Distance to Waterbody | Watershed Name  | 12-digit Watershed number | Water Quality Status TMDL impairments (N, P, Bacteria, Sediment) |
|---------------|---------------------------|-----------------------|-----------------|---------------------------|--|
| Warwick North | Duffy Creek               | >500 ft               | Sassafras River | 021306100357              | Nitrogen Phosphorus Sediment                                     |

### Sensitive Environmental Areas

*Briefly describe any sensitive environmental areas on the farm including streams, wetlands, HEL land, hydric soils, 100 year floodplain, and distance to regulatory waters.*

No sensitive areas were being impacted or diminished by farming activities at the time of the site visits. All required setbacks are outlined in this plan. The nearest body of water is >100 feet from the production facility. The production areas are outside of the 100 year floodplain.

### Environmental Justice (EJ) Score

The EJ Score is an overall evaluation of an area's environment and existing environmental justice indicators; including pollution burden exposure, pollution burden environmental effects, sensitive populations, and socioeconomic factors. This location's score is 42.45 percentile.

The Resource Concern Identification Worksheet is in the Appendix of this document.

| K. | Tons of litter produced per year (less cakeout/crustout) (J/A):     |                            | 4,666   |
| L. | Tons of litter + cake/crust produced per year (I/A)                 |                            | 4,666   |

\* 2007 Delmarva Poultry Litter Production Estimates, George W. Malone, University of Delaware, Georgetown Delaware.

**Quantity of Poultry Litter, Cake/Crust Available per Year**

[illegible]

\*\*\* Cake/Crust not removed due to windrowing, is added with the litter remaining in the house the following year. Windrowing may likely result in actual quantities of litter being less than the estimates shown here. The actual amount of Cake/Crust removed may also be less than the estimated amounts produced due to improved drinker systems, ventilation, etc.

### Description of nearby Water Bodies

The farmstead and production area sits within the Sassafras River Watershed. The associated waterbody is a UNT of the Sassafras River. All production areas, manure storage, manure cleanup - heavy use areas, and mortality management is 200' from any Public Drainage Ditches (PDAs) and/or Streams, Creeks, or Rivers. The farm operation is NOT in a Tier II Watershed.

| Farm Name      | Name of nearest Waterbody | Distance to Waterbody | Watershed Name  | 12-digit Watershed number | Water Quality Status TMDL impairments (N, P, Bacteria, Sediment) |
|----------------|---------------------------|-----------------------|-----------------|---------------------------|--|
| Warwick Pullet | UNT Sassafras River       | 200 ft                | Sassafras River | 021306100357              | Nitrogen Phosphorus Sediment                                     |

### Sensitive Environmental Areas

*Briefly describe any sensitive environmental areas on the farm including streams, wetlands, HEL land, hydric soils, 100 year floodplain, and distance to regulatory waters.*

No sensitive areas were being impacted or diminished by farming activities at the time of the site visits. All required setbacks are outlined in this plan. The nearest body of water is >100 feet from the production facility. The production areas are outside of the 100 year floodplain.

### Environmental Justice (EJ) Score

The EJ Score is an overall evaluation of an area's environment and existing environmental justice indicators; including pollution burden exposure, pollution burden environmental effects, sensitive populations, and socioeconomic factors. This location's score is 42.45 percentile.

### Description of nearby Water Bodies

The farmstead and production area sits within the Upper Chester River Watershed. All production areas, manure storage, manure cleanup - heavy use areas, and mortality management is at a minimum of 500' from any Public Drainage Ditches (PDAs) and/or Streams, Creeks, or Rivers. The farm operation is NOT in a Tier II Watershed.

| Farm Name        | Name of nearest Waterbody | Distance to Waterbody | Watershed Name      | 12-digit Watershed number | Water Quality Status TMDL impairments (N, P, Bacteria, Sediment) |
|------------------|---------------------------|-----------------------|---------------------|---------------------------|--|
| Millington Layer | Cyprus Branch             | >500 ft               | Upper Chester River | 021305100427              | Bacteria Sediment  |

### Sensitive Environmental Areas

*Briefly describe any sensitive environmental areas on the farm including streams, wetlands, HEL land, hydric soils, 100 year floodplain, and distance to regulatory waters.*

No sensitive areas were being impacted or diminished by farming activities at the time of the site visits. All required setbacks are outlined in this plan. The nearest body of water is >100 feet from the production facility. The production areas are outside of the 100 year floodplain.

### Environmental Justice (EJ) Score

The EJ Score is an overall evaluation of an area's environment and existing environmental justice indicators; including pollution burden exposure, pollution burden environmental effects, sensitive populations, and socioeconomic factors. This location's score is 67.12 percentile.

\*\*\* Cake/Crust not removed due to windrowing, is added with the litter remaining in the house the following year. Windrowing may likely result in actual quantities of litter being less than the estimates shown here. The actual amount of Cake/Crust removed may also be less than the estimated amounts produced due to improved drinker systems, ventilation, etc.

Agricultural Nutrient Management Program - (301) 405-1319 - ENST - 0116 Symons Hall - College Park, MD 20742  
Local Governments, US Department of Agriculture Equal Opportunity Programs

revised 3/12/10

### Description of nearby Water Bodies

The farmstead and production area sits within the Upper Chester River Watershed. The associated waterbody is Cyprus Branch. All production areas, manure storage, manure cleanup - heavy use areas, and mortality management is at a minimum of 200' from any Public Drainage Ditches (PDAs) and/or Streams, Creeks, or Rivers. The farm operation is NOT in a Tier II Watershed.

| Farm Name         | Name of nearest Waterbody | Distance to Waterbody | Watershed Name      | 12-digit Watershed number | Water Quality Status TMDL impairments (N, P, Bacteria, Sediment) |
|-------------------|---------------------------|-----------------------|---------------------|---------------------------|--|
| Millington Pullet | Cyprus Branch             | 200 ft                | Upper Chester River | 021305100427              | Nitrogen<br>Phosphorus<br>Bacteria<br>Sediment                   |

### Sensitive Environmental Areas

*Briefly describe any sensitive environmental areas on the farm including streams, wetlands, HEL land, hydric soils, 100 year floodplain, and distance to regulatory waters.*

No sensitive areas were being impacted or diminished by farming activities at the time of the site visits. All required setbacks are outlined in this plan. The nearest body of water is >100 feet from the production facility. The production areas are outside of the 100 year floodplain.

### Environmental Justice (EJ) Score

The EJ Score is an overall evaluation of an area's environment and existing environmental justice indicators; including pollution burden exposure, pollution burden environmental effects, sensitive populations, and socioeconomic factors. This location's score is 67.12 percentile.

The Resource Concern Identification Worksheet is in the Appendix of this document.

### Concentrated Livestock Areas

No outdoor animal concentration areas exist.

| Feedlot ID | Animal |     | Lot Size<br>(sq. feet) | Tributary<br>Areas<br>(type and<br>size) | Cleaning<br>Interval | Lot Surface<br>Type(s) |
|------------|--------|-----|------------------------|--|----------------------|------------------------|
|            | Type   | No. |                        |  |                      |                        |
| N/A        |        |     |                        |  |                      |                        |

Poultry is the only livestock on the Farm.

### Stormwater Management

Poultry pads constructed on each house at Layer Farm(s).

Stormwater comes off the poultry house roofs and is sloped away from the buildings. In the operation, ALL of the stormwater pathways are in vigorous sod and are in good condition.

Stormwater runs away from buildings and directed into these vegetative swales.

#### Manure Management and Storage Facilities

| Storage ID  | Size/Volume of Storage Unit  | Type and Style Liner            | Condition and Thickness of Liner | Meets 313 <sup>1</sup> (Y / N / ?) | Length (days) |

| Millington Pullet   | 120' x 60' x 10'<br>deep   | Manure<br>-<br>Concrete            | Good | Y | 120 |

<sup>1</sup> Was the manure storage system designed and constructed in accordance with NRCS standards in place at time of construction? ☐ Yes ☐ No ☒ Unknown)

Egg wash, at the Millington Layer site, is captured in this style earthen storage. This water is later spray irrigated on grass areas or cropland.

#### Mortality Management

The state required mortality management, where the management of dead carcasses are properly composted before being introduced into the waste stream, is generally not practiced on these production sites. Dead birds are placed directly into the manure piles contained within the manure storage(s). The dead birds have typically been added into the manure stream and due to the high temperatures within the manure piles, the carcass is consumed/composted by the manure.

The management practice of Bird mortality placement into the manure piles will be halted 30 days before a scheduled manure removal export from the facility. This is to ensure all carcasses have been properly composted before manure piles are removed from the storage containment facility.

#### Stacking Areas

No outside stacking areas exist. No long-term manure stacking is conducted. All manure stays in manure storage or under production floor until arrangements for truck export is obtained.

Resource Concerns: N/A

#### Wells

| Well ID | Depth |  | Condition |  |
|---------|-------|--|-----------|--|
|---------|-------|--|-----------|--|

|                   | Well     | Water | Type of Construction |      | Test Results (Nitrate/Bacteria) |
|-------------------|----------|-------|----------------------|------|---------------------------------|
| Warwick North     | > 100 ft | Good  | Traditional          | Good |                                 |

| Warwick North     | >100 ft  | Good  | Traditional          | Good |                                 |
| Warwick North     | > 100 ft | Good  | Traditional          | Good |                                 |
| Warwick South     | > 100 ft | Good  | Traditional          | Good |                                 |
| Warwick South     | > 100 ft | Good  | Traditional          | Good |                                 |
| Warwick South     | > 100 ft | Good  | Traditional          | Good |                                 |
| Warwick Pullet    | > 200 ft | Good  | Traditional          | Good |                                 |
| Millington Layer  | > 200 ft | Good  | Traditional          | Good |                                 |
| Millington Layer  | > 100 ft | Good  | Traditional          | Good |                                 |
| Millington Layer  | > 100 ft | Good  | Traditional          | Good |                                 |
| Millington Pullet | > 100 ft | Good  | Traditional          | Good |                                 |

Document any observed risks such as proximity to contamination sources, surface runoff near well, well condition or unused wells that are not properly abandoned.

#### Surface Water Runoff

Clean water, from storm events and dirty water from residues from house fans and HUAs are being serviced by the same ditches and vegetation.

The areas that surface water flows through, is handled in thick vegetation. Ditches prevent water from entering buildings and directs storm flows out of the Headquarters and away from production.

#### Air Quality

Are any of the following a concern at the facility itself, or to nearby neighbors? If so, describe the issues in terms of timing, extent, etc.

- **Dust:** normal levels for a layer house ventilation system
- **Gaseous Emissions:** No
- **Odor:** Normal.
- **Other Potential Resource Concerns:** No other problems are apparent.

68

### Waste Handling and Transfer Systems

**Belt-style Houses:** Manure from cage areas is belted away from the production area. The series of belts carry manure to a roofed stack area. This roofed structure, is constructed at the end of the production building.

**Non-Belt Houses:** Manure drops from the cage area and ends up in the pit/basement style storage. The manure management practice, for the non-belt style houses, is to push manure out the back end of each house, onto a concrete pad. Manure may be stockpiled on pad longer time frame than desired.

### Practice and Facility Management Plan (Best Management Practice implementation)

## **Operation and Maintenance**

### **Critical Area Planting (CAP) and Filter Strips**

- ~ Vegetation must be maintained in vigorous condition.
- ~ In order to keep the optimum sediment retention and other water quality benefits, mow 3-4 times annually to a height 3 to 5 inches.
- ~ Control undesirable plants by pulling, mowing, or spraying with selective herbicide. Control noxious weeds as required by state law.
- ~ Maintain sheet flow entering the filter strip. Repair all rills and small channels within this vegetative area.
- ~ Sediment that accumulates along the upper part and within the filter strip area shall be removed before it accumulates to a height that diverts runoff water away from the vegetative filter area. The area disturbed by this removal shall be re-graded and reseeded.

### **Heavy Use Area (HUA or Poultry Pads)**

- ~ Maintain a stable, non-eroding surface for areas frequently used by vehicles or animals.
- ~ Maintain and repair adjacent companion conservation practices that handle sediment, nutrients, particulate matter, and organic matter.
- ~ After each and every manure handling or bird removal event that leaves behind, manure, litter, and or debris on the HUA surface; it must be cleaned-up. In all cases, material left behind on the HUA must be swept-up or vacuumed.
- ~ Repair any deteriorating areas.
- ~ Maintain flow into filter areas by removing accumulated solids, reconstructing waterbars, etc.

### **Waste Storage Facility - 313**

- ~ Check walls and floors often - minimum of 2 times a year when facility is empty - for cracks and/or separations. Where concrete is used make inspections and repair as needed.
- ~ All building materials shall be kept in good working condition free from defect.
- ~ Check backfill areas around structure (concrete, steel, timber, etc) often for excessive settlement. Determine if the settlement is caused by backfill consolidation, piping, or failure of the structure walls or floor. Necessary repairs must be made.
- ~ Outlets of foundations and sub-drains should be checked frequently and kept open. The outflow from these drains should be checked when the facility is being used to determine if there is leakage from the storage structure into these drains.
- ~ Trusses/roof supports shall be examined during snowfall events.
- ~ Roof materials shall be replaced as wear/leakage occurs. Metal roofing may require periodic painting.

### **Access Road - 560**

- ~ Inspect culverts, roadside ditches, water bars and outlets after each major runoff event and restore flow capacity as needed;
- ~ Maintain grass areas in adequate cover. Reseed and mow as needed;
- ~ Fill low areas in travel treads and regrade, as needed, to maintain road cross section;
- ~ Inspect roads with water bars periodically to insure proper cross section is available and outlets are stable.

## Production Area Management Guidelines – Poultry Operations

To provide environmental benefits, conservation practices must be operated and maintained as designed. The following list describes some common problems to look for in the production area of poultry operations. It is VERY IMPORTANT that the production area (manure storage, composters, HUA pads, etc...) be kept clean and free from ANY manure that could come in contact with surface water. Natural Resources Conservation Service (NRCS) and Soil Conservation District staff are available to provide follow-up assistance if needed.

### Manure Storage Area

Manure removed from poultry houses should be stored in a covered shed until it can be applied to crops or otherwise used. The following are potential problems you may see that MUST be addressed to keep clean water on your farm, clean:

- Manure piled outside shed.
- Manure stacked too high against walls.
- Shed contains equipment or supplies that are not easily moveable (e.g., not on wheels).
- Obvious surface water conveyance near the open ends of the shed to a drainage ditch or swale.
- Structural damage to shed.
- Evidence of water or "puddling" in the storage shed.

### Composters

Properly operated composters provide an environmentally sound method for disposing of normal mortality from poultry houses.

The following are potential problems you may see:

- Leakage.
- Excessive odor or flies.
- Dead birds visible.
- Evidence of animals feeding on dead birds.
- Thermometer not readily available (DE only).
- Recipe sign not posted (DE only).
- Missing or broken boards.
- Misuse and nonuse. Composter should be used for what it was intended for.

### Concrete Pads

Concrete pads at the ends of poultry houses and manure sheds can reduce erosion and protect surface and ground water from contamination.

Concrete pads should be properly installed, maintained, and kept clean of manure.

The following are potential problems you may see:

- Manure present on pads.
- Obvious surface water conveyance to a drainage ditch or swale near the open ends of poultry houses and manure sheds.
- Concrete cracking or breaking off.

### **Proper and maintained Vegetation Around Production Area and Between Houses**

It is very important to have good grass cover around the farm buildings and between the poultry houses. Well established grasses also prevent soil erosion which in severe cases could result in damage to the house pad or the footing and foundation of the poultry house. Grass also helps reduce reflected heat which in turn helps keep house temperatures under control in hot weather. Grass should always be kept mowed and weeds should also be kept under control. Not only are un-mowed weeds and grass unsightly, but they can encourage rodents and can also reduce the effectiveness of natural ventilation. Tall weeds and grass provide rats and mice a place to hide that is close to the building. Most rodent control programs will stress the need to keep areas around buildings mowed frequently.

Standing puddles of water encourage mosquitoes and kill vegetation, so low spots should be filled to prevent such problems. Also, drainage ditches, drainage ways, and swales should be properly mowed and maintained to give storm water an easy exit. Any trash and debris should be removed from ditches and grass and weeds kept short to encourage water flow.

### **Windbreak/Shelterbelt**

Windbreaks, or vegetative environmental buffers, are planted around poultry houses to provide shelter from winter winds; reduce particulates, ammonia, and other odors from tunnel fans; create visual screens; and provide shade to reduce extreme summer heat.

The following are potential problems you may see:

- Trees dead, dying, or damaged (e.g., broken off, mowed over, bagworms, etc.).
- Lack of weed control around trees or insect control.
- Irrigation system not functioning (e.g., major leaks, broken lines, etc.).
- No irrigation system (newly established trees should be irrigated for the first 2-3 years).

### **Other Concerns**

Other issues that may result in environmental concerns include, but are not limited to:

- Manure scattered around the production area on roads, along the edge of concrete pads or building foundations.
- Manure runoff visible.
- Roof runoff that is creating erosion or drainage problems.
- Lack of good vegetative cover for filtering storm runoff between waste storage structures, composters, or ends of the poultry houses, and drainage outlets.
- Overall farm appearance (a farm that "looks good" is less likely to generate complaints from neighbors).
- Potholes in travelways or standing water in swales, near exhaust fans.
- Maintenance of stormwater management structures or ponds.

## Land Treatment Practices

This element addresses evaluation and implementation of appropriate conservation practices on sites proposed for land application of manure and organic by-products from an Animal Feeding Operation. On fields where manure and organic by-products are applied as beneficial nutrients, it is essential that runoff and soil erosion be minimized to allow for plant uptake of these nutrients.

This element addresses evaluation and implementation of appropriate conservation practices on sites proposed for land application of manure and organic by-products from an Animal Feeding Operation. On fields where manure and organic by-products are applied as beneficial nutrients, it is essential that runoff and soil erosion be minimized to allow for plant uptake of these nutrients.

### Land Treatment Practices and Expected Results:

#### A. Applied Land Treatment Practices

Necessary conservation practices have been or will be established and maintained on cropland where animal by-products are applied before the first application. All fields need a field border, residue management, as well as vegetative field strips established when next to a ditch, stream, or wetlands.

CAL-MAINE FOODS  
1052 HIGHLAND COLONY PKWY  
SUITE 200  
RIDGELAND, MS 39157

RICH LEVELS  
ALLEN DAVIS  
33960 SASSAFRAS-CALDWELL ROAD  
GALENA, MD 21635

### OBJECTIVES

The Conservation Plan addresses best management practices for sustaining and improving the natural resource base on the farm. It is the responsibility of the landuser to obtain all necessary or appropriate permits. All practices are to be maintained to ensure that their intended purposes are achieved. No significant cultural resources are known to exist on the farm.

The only portions of this farm receiving egg wash is the Irrigation center pivot footprint (125 ac).

### Cropland

#### Crawford Farm

#### Conservation Crop Rotation (328)

Plant crops as listed: Rotation of CORN followed by Soybeans or followed with Wheat or Soybeans. Generally high residue no-tilled crops such as corn, grain, or hay crops may be added to the rotation without increasing soil loss. Crops with low residues and with tillage generally cannot be added to the rotation without the additional use of conservation practices or by adding additional years of high residue no-till crops or hay to the rotation. Lime and fertilizer will be applied based on soil tests and current PSU Agronomy Guide recommendations. When soil tests are high in P and/or K, recommendations may indicate that no nutrient applications are needed.

| Field  | Planned Amount | Month | Year | Applied Amount | Date       |
|--------|----------------|-------|------|----------------|------------|
| 4      | 78 ac          | 10    | 2023 | 78 ac          | 10/31/2023 |
| 6      | 41 ac          | 10    | 2023 | 41 ac          | 10/31/2023 |
| 7      | 64 ac          | 10    | 2023 | 64 ac          | 10/31/2023 |
| Total: | 183 ac         |       |      | 183 ac         |            |

#### Nutrient Management Plan (590)

Manage the amount, form, placement and timing of plant nutrient application to protect surface & groundwater from runoff and/or leaching of nutrients. The land application of animal manures and agricultural process wastewater must follow the standards outlined by the Department of Agriculture. The standard requires the development and implementation of a plan to manage nutrients for water quality protection.

Soil tests must be completed at least once every three years and records of soil test results and nutrient application timing and rates must be maintained.

| Field  | Planned Amount | Month | Year | Applied Amount | Date       |
|--------|----------------|-------|------|----------------|------------|
| 4      | 78 ac          | 10    | 2023 | 78 ac          | 10/31/2023 |
| 6      | 41 ac          | 10    | 2023 | 41 ac          | 10/31/2023 |
| 7      | 64 ac          | 10    | 2023 | 64 ac          | 10/31/2023 |
| Total: | 183 ac         |       |      | 152 ac         |            |

#### Residue and Tillage Management, No-Till (329)

Establish the following crops using No-till equipment and practices: A rotation of Corn, Soybeans, and/or Small Grain with dc Soybeans. These crops will be planted directly into prior crop residues when conditions allow. CORN no-tilled following dc Soybeans will have a 40% residue level. Soybeans will have a 40-50% residue levels behind corn. Small grain crops following corn, 30-40% residue; dc Soybean crops will be no-tilled.

Use no-till planting methods to plant crops into surface residues to reduce sheet and rill erosion and improve soil quality. For further information including tillage and tools, use of manures and remaining residue amounts is found on the attached Job Sheet for No-Till Residue Management. Soil loss predictions and Soil Conditioning Index results, as calculated by RUSLE2, are attached. Contact the Conservation Planner if changes in crops, tillage, or residue levels are desired. For Operation and Maintenance, evaluate crop residue remaining after planting to ensure that appropriate residue levels are maintained.

| Field  | Planned Amount | Month | Year | Applied Amount | Date       |
|--------|----------------|-------|------|----------------|------------|
| 4      | 78 ac          | 10    | 2023 | 78 ac          | 10/31/2023 |
| 6      | 41 ac          | 10    | 2023 | 41 ac          | 10/31/2023 |
| 7      | 64 ac          | 10    | 2023 | 64 ac          | 10/31/2023 |
| Total: | 183 ac         |       |      | 183 ac         |            |

88

### Residue and Tillage Management, Mulch Till (345)

Establish the following crops: A rotation of Corn, Soybeans, and Small Grain. 30% RESIDUE AMOUNTS AFTER CORN PLANTING. Small grain crops following soybeans, 30% residue. Soybeans are no-tilled. Occasionally, due to equipment tracking and solid manure application; light verticle tillage may occur in order to properly establish the fall small grain. Corn stubble/residue is verticle tilled, ahead of proceeding crop, to cut up heavy residue.

Mulch tillage helps to reduce soil erosion and energy use, improve soil quality, and increase plant-available moisture. Manage the amount, orientation, and distribution of the crop and plant residue by limiting the amount of tillage occurring in the field. Soil loss predictions and Soil Conditioning Index results, as calculated by RUSLE2, are attached. Contact the NRCS or Soil Conservation District office if changes in crops, tillage, or residue levels are desired. For Operation and Maintenance, evaluate crop residue remaining after planting to ensure that appropriate residue levels are maintained.

## **Cal-Maine Foods, Inc.**

### **Soil Types**

#### **Cecil County, Maryland**

**Map Unit: BuA—Butlertown silt loam, 0 to 2 percent slopes**

**Component: Butlertown (70%)**

The Butlertown component makes up 70 percent of the map unit. Slopes are 0 to 2 percent. This component is on Coastal Plain uplands. The parent material consists of silty eolian deposits over sandy or loamy fluviomarine deposits. Depth to a root restrictive layer, fragipan, is 24 to 39 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 26 inches (depth from the mineral surface is 24 inches) during February, March. Organic matter content in the surface horizon is about 60 percent. Below this thin organic horizon the organic matter content is about 5 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 2w. This soil does not meet hydric criteria.

**Component: Mattapex (20%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Hambrook (5%)**

Generated brief soil descriptions are created for major soil components. The Hambrook soil is a minor component.

**Component: Othello (5%)**

Generated brief soil descriptions are created for major soil components. The Othello soil is a minor component.

**Map Unit: BuB—Butlertown silt loam, 2 to 5 percent slopes**

**Component: Butlertown (65%)**

The Butlertown component makes up 65 percent of the map unit. Slopes are 2 to 5 percent. The parent material consists of silty eolian deposits over sandy or loamy fluviomarine deposits. Depth to a root restrictive layer, fragipan, is 24 to 39 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 26 inches (depth from the mineral surface is 24 inches) during February, March. Organic matter content in the surface horizon is about 60 percent. Below this thin organic horizon the organic matter content is about 5 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 2e. This soil does not meet hydric criteria.

**Component: Mattapex (20%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Hambrook (10%)**

Generated brief soil descriptions are created for major soil components. The Hambrook soil is a minor component.

**Component: Othello (5%)**

Generated brief soil descriptions are created for major soil components. The Othello soil is a minor component.

**Map Unit: CmC—Collington loam, 5 to 10 percent slopes**

**Component: Collington (70%)**

The Collington component makes up 70 percent of the map unit. Slopes are 5 to 10 percent. This component is on hillslopes, Coastal Plain uplands. The parent material consists of glauconite bearing loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 3e. This soil does not meet hydric criteria.

**Component: Sassafras (15%)**

Generated brief soil descriptions are created for major soil components. The Sassafras soil is a minor component.

**Component: Wist (10%)**

Generated brief soil descriptions are created for major soil components. The Wist soil is a minor component.

**Component: Mattapex (5%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Map Unit: CsA—Crosiadore silt loam, 0 to 2 percent slopes**

**Component: Crosiadore (75%)**

The Crosiadore component makes up 75 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, lowlands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is somewhat poorly drained. Water movement in the most restrictive layer is moderately low. Available

water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 14 inches during January, February, March. Organic matter content in the surface horizon is about 3 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 3w. This soil does not meet hydric criteria.

**Component: Mattapex (10%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Othello (5%)**

Generated brief soil descriptions are created for major soil components. The Othello soil is a minor component.

**Component: Kentuck (5%)**

Generated brief soil descriptions are created for major soil components. The Kentuck soil is a minor component.

**Component: Elkton (5%)**

Generated brief soil descriptions are created for major soil components. The Elkton soil is a minor component.

**Map Unit: CsB—Crosiadore silt loam, 2 to 5 percent slopes**

**Component: Crosiadore (75%)**

The Crosiadore component makes up 75 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, lowlands. The parent material consists of silty eolian deposits over fluvio-marine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is somewhat poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 14 inches during January, February, March. Organic matter content in the surface horizon is about 3 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 3w. This soil does not meet hydric criteria.

**Component: Mattapex (10%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Othello (5%)**

Generated brief soil descriptions are created for major soil components. The Othello soil is a minor component.

**Component: Elkton (5%)**

93

Generated brief soil descriptions are created for major soil components. The Elkton soil is a minor component.

**Component: Kentuck (5%)**

Generated brief soil descriptions are created for major soil components. The Kentuck soil is a minor component.

**Map Unit: FacA—Fallsington sandy loams, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Fallsington, undrained (48%)**

The Fallsington, undrained component makes up 48 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is occasionally ponded. A seasonal zone of water saturation is at 5 inches (depth from the mineral surface is 3 inches) during January, February, March, April. Organic matter content in the surface horizon is about 68 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 5w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Fallsington, drained (25%)**

The Fallsington, drained component makes up 25 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is rarely ponded. A seasonal zone of water saturation is at 14 inches during January, February, March, April. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 3w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Marshyhope (8%)**

Generated brief soil descriptions are created for major soil components. The Marshyhope soil is a minor component.

**Component: Woodstown (7%)**

Generated brief soil descriptions are created for major soil components. The Woodstown soil is a minor component.

**Component: Hammonton (5%)**

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Othello (5%)**

94

Generated brief soil descriptions are created for major soil components. The Othello soil is a minor component.

**Map Unit: HbB—Hambrook sandy loam, 2 to 5 percent slopes**

**Component: Hambrook (80%)**

The Hambrook component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, uplands. The parent material consists of loamy fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 45 inches during January. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria.

**Component: Cedartown (5%)**

Generated brief soil descriptions are created for major soil components. The Cedartown soil is a minor component.

**Component: Hammonton (5%)**

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Sassafras (5%)**

Generated brief soil descriptions are created for major soil components. The Sassafras soil is a minor component.

**Component: Woodstown (5%)**

Generated brief soil descriptions are created for major soil components. The Woodstown soil is a minor component.

**Map Unit: KpA—Keyport silt loam, 0 to 2 percent slopes**

**Component: Keyport (80%)**

The Keyport component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of silty and clayey eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY120MD Moist Clayey Upland ecological site. Nonirrigated land capability classification is 2w. This soil does not meet hydric criteria.

**Component: Mattapex (10%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Crosiadore (5%)**

Generated brief soil descriptions are created for major soil components. The Crosiadore soil is a minor component.

**Component: Lenni, drained (5%)**

Generated brief soil descriptions are created for major soil components. The Lenni, drained soil is a minor component.

**Map Unit: MkA—Matapeake silt loam, 0 to 2 percent slopes**

**Component: Matapeake (80%)**

The Matapeake component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the F153CY030MD Well Drained Loess Upland ecological site. Nonirrigated land capability classification is 1. Irrigated land capability classification is 1. This soil does not meet hydric criteria.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Butlertown (5%)**

Generated brief soil descriptions are created for major soil components. The Butlertown soil is a minor component.

**Component: Mattapex (5%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Map Unit: MkB—Matapeake silt loam, 2 to 5 percent slopes**

**Component: Matapeake (80%)**

The Matapeake component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of

60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the F153CY030MD Well Drained Loess Upland ecological site. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Mattapex (5%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Butlertown (5%)**

Generated brief soil descriptions are created for major soil components. The Butlertown soil is a minor component.

**Map Unit: MkC—Matapeake silt loam, 5 to 10 percent slopes**

**Component: Matapeake (80%)**

The Matapeake component makes up 80 percent of the map unit. Slopes are 5 to 10 percent. This component is on hillock low hills, uplands. The parent material consists of silty eolian deposits over fluvio-marine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the F153CY030MD Well Drained Loess Upland ecological site. Nonirrigated land capability classification is 3e. Irrigated land capability classification is 3e. This soil does not meet hydric criteria.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Mattapex (5%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Greenwich (5%)**

Generated brief soil descriptions are created for major soil components. The Greenwich soil is a minor component.

**Map Unit: MtcA—Mattapex silt loam, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Mattapex (80%)**

The Mattapex component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, coastal plains. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 2w. Irrigated land capability classification is 2w. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Othello, drained (5%)**

Generated brief soil descriptions are created for major soil components. The Othello, drained soil is a minor component.

**Component: Crosiadore (5%)**

Generated brief soil descriptions are created for major soil components. The Crosiadore soil is a minor component.

**Map Unit: MtcB—Mattapex silt loam, 2 to 5 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Mattapex (80%)**

The Mattapex component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Crosiadore (5%)**

Generated brief soil descriptions are created for major soil components. The Crosiadore soil is a minor component.

Component: Othello, drained (5%)

Generated brief soil descriptions are created for major soil components. The Othello, drained soil is a minor component.

**Map Unit: NsA—Nassawango silt loam, 0 to 2 percent slopes**

Component: Nassawango (80%)

The Nassawango component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 45 inches during January. Organic matter content in the surface horizon is about 1 percent. This component is in the F153CY030MD Well Drained Loess Upland ecological site. Nonirrigated land capability classification is 1. Irrigated land capability classification is 1. This soil does not meet hydric criteria.

Component: Matapeake (5%)

Generated brief soil descriptions are created for major soil components. The Matapeake soil is a minor component.

Component: Mattapex (5%)

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

Component: Crosiadore (5%)

Generated brief soil descriptions are created for major soil components. The Crosiadore soil is a minor component.

Component: Othello, drained (5%)

Generated brief soil descriptions are created for major soil components. The Othello, drained soil is a minor component.

**Map Unit: NsB—Nassawango silt loam, 2 to 5 percent slopes**

Component: Nassawango (80%)

The Nassawango component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not

ponded. A seasonal zone of water saturation is at 45 inches during January. Organic matter content in the surface horizon is about 1 percent. This component is in the F153CY030MD Well Drained Loess Upland ecological site. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria.

Generated brief soil descriptions are created for major soil components. The Matapeake soil is a minor component.

**Component: Othello, drained (5%)**

Generated brief soil descriptions are created for major soil components. The Othello, drained soil is a minor component.

**Map Unit: SacC—Sassafras sandy loam, 5 to 10 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Sassafras (80%)**

The Sassafras component makes up 80 percent of the map unit. Slopes are 5 to 10 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 3e. Irrigated land capability classification is 3e. This soil does not meet hydric criteria.

**Component: Ingleside (10%)**

Generated brief soil descriptions are created for major soil components. The Ingleside soil is a minor component.

**Component: Downer (5%)**

Generated brief soil descriptions are created for major soil components. The Downer soil is a minor component.

**Component: Woodstown (5%)**

Generated brief soil descriptions are created for major soil components. The Woodstown soil is a minor component.

**Map Unit: VnaB—Urban land-Nassawango complex, 0 to 5 percent slopes**

Component: Urban land (55%)

Generated brief soil descriptions are created for major soil components. The Urban land is a miscellaneous area.

Component: Nassawango (35%)

The Nassawango component makes up 35 percent of the map unit. Slopes are 0 to 5 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 45 inches during January. Organic matter content in the surface horizon is about 1 percent. This component is in the F153CY030MD Well Drained Loess Upland ecological site. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria.

Component: Udorthents, loamy (10%)

Generated brief soil descriptions are created for major soil components. The Udorthents, loamy soil is a minor component.

**Map Unit: WdcA—Woodstown sandy loam, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

Component: Woodstown (80%)

The Woodstown component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY130NJ Moist Loamy Upland ecological site. Nonirrigated land capability classification is 2w. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

Component: Fallsington (6%)

Generated brief soil descriptions are created for major soil components. The Fallsington soil is a minor component.

Component: Hammonton (6%)

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Mattapex (4%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Hambrook (4%)**

Generated brief soil descriptions are created for major soil components. The Hambrook soil is a minor component.

**Map Unit: WdcB—Woodstown sandy loam, 2 to 5 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Woodstown (80%)**

The Woodstown component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY130NJ Moist Loamy Upland ecological site. Nonirrigated land capability classification is 2e. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Hammonton (6%)**

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Fallsington, occasionally ponded (6%)**

Generated brief soil descriptions are created for major soil components. The Fallsington, occasionally ponded soil is a minor component.

**Component: Hambrook (4%)**

Generated brief soil descriptions are created for major soil components. The Hambrook soil is a minor component.

**Component: Mattapex (4%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Map Unit: Za—Zekiah sandy loam, frequently flooded**

**Component: Zekiah (75%)**

The Zekiah component makes up 75 percent of the map unit. Slopes are 0 to 1 percent. This component is on flood plains, coastal plains. The parent material consists of loamy alluvium. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted

depth) is high. Shrink-swell potential is low. This soil is frequently flooded. It is frequently ponded. A seasonal zone of water saturation is at 5 inches during January, February, March, April, May, June, July, August, September, October, November, December. Organic matter content in the surface horizon is about 4 percent. This component is in the R149AY060DE Wet Alluvial Floodplain ecological site. Nonirrigated land capability classification is 5w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Longmarsh (10%)**

Generated brief soil descriptions are created for major soil components. The Longmarsh soil is a minor component.

**Component: Askecksy, undrained (5%)**

Generated brief soil descriptions are created for major soil components. The Askecksy, undrained soil is a minor component.

**Component: Hammonton (5%)**

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Fallsington, undrained (5%)**

Generated brief soil descriptions are created for major soil components. The Fallsington, undrained soil is a minor component.

## Kent County, Maryland

**Map Unit: Em—Elkton silt loam, 0 to 2 percent slopes**

**Component: Elkton, undrained (40%)**

The Elkton, undrained component makes up 40 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, lowlands. The parent material consists of silty eolian deposits and/or fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is occasionally ponded. A seasonal zone of water saturation is at 5 inches (depth from the mineral surface is 2 inches) during January, February, March, April. Organic matter content in the surface horizon is about 57 percent. Below this thin organic horizon the organic matter content is about 5 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 5w. This soil meets hydric criteria.

**Component: Elkton, drained (35%)**

The Elkton, drained component makes up 35 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, lowlands. The parent material consists of silty eolian deposits and/or fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is rarely ponded. A seasonal zone of water saturation is at 14 inches during January, February, March, April. Organic matter content in the surface horizon is about 3 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 3w. This soil meets hydric criteria.

**Component: Crosiadore (10%)**

Generated brief soil descriptions are created for major soil components. The Crosiadore soil is a minor component.

**Component: Kentuck, undrained (5%)**

Generated brief soil descriptions are created for major soil components. The Kentuck, undrained soil is a minor component.

**Component: Keyport (5%)**

Generated brief soil descriptions are created for major soil components. The Keyport soil is a minor component.

**Component: Mattapex (5%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Map Unit: FacA—Fallsington sandy loams, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Fallsington, undrained (48%)**

The Fallsington, undrained component makes up 48 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is occasionally ponded. A seasonal zone of water saturation is at 5 inches (depth from the mineral surface is 3 inches) during January, February, March, April. Organic matter content in the surface horizon is about 68 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 5w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Fallsington, drained (25%)**

The Fallsington, drained component makes up 25 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is rarely ponded. A seasonal zone of water saturation is at 14 inches during January, February, March, April. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 3w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Marshyhope (8%)**

Generated brief soil descriptions are created for major soil components. The Marshyhope soil is a minor component.

**Component: Woodstown (7%)**

Generated brief soil descriptions are created for major soil components. The Woodstown soil is a minor component.

**Component: Othello (5%)**

Generated brief soil descriptions are created for major soil components. The Othello soil is a minor component.

**Component: Hammonton (5%)**

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Map Unit: FgcA—Fallsington loams, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Fallsington, undrained (38%)**

The Fallsington, undrained component makes up 38 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is occasionally ponded. A seasonal zone of water saturation is at 5 inches (depth from the mineral surface is 3 inches) during January, February, March, April. Organic matter content in the surface horizon is about 68 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 5w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Fallsington, drained (37%)**

The Fallsington, drained component makes up 37 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is rarely ponded. A seasonal zone of water saturation is at 14 inches during January, February, March, April. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 3w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Marshyhope (5%)**

Generated brief soil descriptions are created for major soil components. The Marshyhope soil is a minor component.

**Map Unit: FmB—Fort Mott loamy sand, 0 to 5 percent slopes**

**Component: Fort Mott (100%)**

The Fort Mott component makes up 100 percent of the map unit. Slopes are 0 to 5 percent. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the F153DY160NJ Well Drained Coarse-Loamy Upland ecological site. Nonirrigated land capability classification is 2s. Irrigated land capability classification is 2s. This soil does not meet hydric criteria.

**Map Unit: GaB—Galestown loamy sand, 0 to 5 percent slopes**

**Component: Galestown (80%)**

The Galestown component makes up 80 percent of the map unit. Slopes are 0 to 5 percent. This component is on fluviomarine terraces, flats, uplands. The parent material consists of sandy eolian deposits and/or sandy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is somewhat excessively drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is low. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the F153DY170NJ Sandy, Excessively Drained Upland ecological site. Nonirrigated land capability classification is 3s. Irrigated land capability classification is 2s. This soil does not meet hydric criteria.

**Component: Cedartown (5%)**

Generated brief soil descriptions are created for major soil components. The Cedartown soil is a minor component.

**Component: Fort Mott (5%)**

Generated brief soil descriptions are created for major soil components. The Fort Mott soil is a minor component.

**Component: Runclint (5%)**

Generated brief soil descriptions are created for major soil components. The Runclint soil is a minor component.

**Component: Ingleside (5%)**

Generated brief soil descriptions are created for major soil components. The Ingleside soil is a minor component.

**Map Unit: GaD—Galestown loamy sand, 5 to 15 percent slopes**

**Component: Galestown (80%)**

The Galestown component makes up 80 percent of the map unit. Slopes are 5 to 15 percent. This component is on fluvio-marine terraces, flats, uplands. The parent material consists of sandy eolian deposits and/or sandy fluvio-marine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is somewhat excessively drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is low. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the F153DY170NJ Sandy, Excessively Drained Upland ecological site. Nonirrigated land capability classification is 4e. Irrigated land capability classification is 4e. This soil does not meet hydric criteria.

**Component: Fort Mott (5%)**

Generated brief soil descriptions are created for major soil components. The Fort Mott soil is a minor component.

**Component: Runclint (5%)**

Generated brief soil descriptions are created for major soil components. The Runclint soil is a minor component.

**Component: Cedartown (5%)**

Generated brief soil descriptions are created for major soil components. The Cedartown soil is a minor component.

**Component: Ingleside (5%)**

Generated brief soil descriptions are created for major soil components. The Ingleside soil is a minor component.

**Map Unit: KmA—Keyport fine sandy loam, 0 to 2 percent slopes**

**Component: Keyport (85%)**

The Keyport component makes up 85 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of silty and clayey fluvio-marine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in

the surface horizon is about 2 percent. This component is in the F149AY120MD Moist Clayey Upland ecological site. Nonirrigated land capability classification is 2w. Irrigated land capability classification is 2w. This soil does not meet hydric criteria.

**Component: Rosedale (5%)**

Generated brief soil descriptions are created for major soil components. The Rosedale soil is a minor component.

**Component: Lenni (5%)**

Generated brief soil descriptions are created for major soil components. The Lenni soil is a minor component.

**Component: Pepperbox (5%)**

Generated brief soil descriptions are created for major soil components. The Pepperbox soil is a minor component.

**Map Unit: LO—Longmarsh and Indiantown soils, frequently flooded**

**Component: Longmarsh (43%)**

The Longmarsh component makes up 43 percent of the map unit. Slopes are 0 to 1 percent. This component is on flood plains, coastal plains. The parent material consists of loamy alluvium. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is very poorly drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is frequently flooded. It is frequently ponded. A seasonal zone of water saturation is at 5 inches (depth from the mineral surface is 3 inches) during January, February, March, April, May, June, July, August, September, October, November, December. Organic matter content in the surface horizon is about 68 percent. Below this thin organic horizon the organic matter content is about 13 percent. This component is in the R149AY060DE Wet Alluvial Floodplain ecological site. Nonirrigated land capability classification is 5w. This soil meets hydric criteria.

**Component: Indiantown (37%)**

The Indiantown component makes up 37 percent of the map unit. Slopes are 0 to 1 percent. This component is on flood plains, coastal plains. The parent material consists of loamy alluvium. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is very poorly drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is frequently flooded. It is frequently ponded. A seasonal zone of water saturation is at 5 inches (depth from the mineral surface is 3 inches) during January, February, March, April, May, June, July, August, September, October, November, December. Organic matter content in the surface horizon is about 68 percent. Below this thin organic horizon the organic matter content is about 12 percent. This component is in the R149AY060DE Wet

Alluvial Floodplain ecological site. Nonirrigated land capability classification is 5w. This soil meets hydric criteria.

**Component: Zekiah (10%)**

Generated brief soil descriptions are created for major soil components. The Zekiah soil is a minor component.

**Component: Klej (5%)**

Generated brief soil descriptions are created for major soil components. The Klej soil is a minor component.

**Component: Manahawkin (5%)**

Generated brief soil descriptions are created for major soil components. The Manahawkin soil is a minor component.

**Map Unit: MnA—Matapeake silt loam, 0 to 2 percent slopes**

**Component: Matapeake (80%)**

The Matapeake component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluvio-marine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the F153CY030MD Well Drained Loess Upland ecological site. Nonirrigated land capability classification is 1. Irrigated land capability classification is 1. This soil does not meet hydric criteria.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Mattapex (5%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Butlertown (5%)**

Generated brief soil descriptions are created for major soil components. The Butlertown soil is a minor component.

**Map Unit: MnB—Matapeake silt loam, 2 to 5 percent slopes**

**Component: Matapeake (80%)**

The Matapeake component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the F153CY030MD Well Drained Loess Upland ecological site. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Butlertown (5%)**

Generated brief soil descriptions are created for major soil components. The Butlertown soil is a minor component.

**Component: Mattapex (5%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Map Unit: MpA—Mattapex fine sandy loam, 0 to 2 percent slopes**

**Component: Mattapex (80%)**

The Mattapex component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, uplands. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 2w. Irrigated land capability classification is 2w. This soil does not meet hydric criteria.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Othello, drained (5%)**

Generated brief soil descriptions are created for major soil components. The Othello, drained soil is a minor component.

**Component: Crosiadore (5%)**

Generated brief soil descriptions are created for major soil components. The Crosiadore soil is a minor component.

**Map Unit: MpB—Mattapex fine sandy loam, 2 to 5 percent slopes**

**Component: Mattapex (100%)**

The Mattapex component makes up 100 percent of the map unit. Slopes are 2 to 5 percent. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 27 inches during January, February, March, April. Organic matter content in the surface horizon is about 2 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 2e. This soil does not meet hydric criteria.

**Map Unit: MtcA—Mattapex silt loam, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Mattapex (80%)**

The Mattapex component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, coastal plains. The parent material consists of silty eolian deposits over fluviomarine sediments. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F153CY020MD Moist Loess Upland ecological site. Nonirrigated land capability classification is 2w. Irrigated land capability classification is 2w. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Nassawango (10%)**

Generated brief soil descriptions are created for major soil components. The Nassawango soil is a minor component.

**Component: Othello, drained (5%)**

Generated brief soil descriptions are created for major soil components. The Othello, drained soil is a minor component.

**Component: Crosiadore (5%)**

Generated brief soil descriptions are created for major soil components. The Crosiadore soil is a minor component.

**Map Unit: Oh—Othello silt loams, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Othello, drained (48%)**

The Othello, drained component makes up 48 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, coastal plains. The parent material consists of silty eolian deposits over fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is rarely ponded. A seasonal zone of water saturation is at 14 inches during January, February, March, April. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 3w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Othello, undrained (28%)**

The Othello, undrained component makes up 28 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats on coastal plains. The parent material consists of silty eolian deposits over fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is low. This soil is not flooded. It is occasionally ponded. A seasonal zone of water saturation is at 5 inches (depth from the mineral surface is 3 inches) during January, February, March, April. Organic matter content in the surface horizon is about 68 percent. This component is in the F149AY090NJ Coastal Plain Hardwood Swamp ecological site. Nonirrigated land capability classification is 5w. This soil meets hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Crosiadore (7%)**

Generated brief soil descriptions are created for major soil components. The Crosiadore soil is a minor component.

**Component: Mattapex (7%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Kentuck, undrained (5%)**

Generated brief soil descriptions are created for major soil components. The Kentuck, undrained soil is a minor component.

**Component: Fallsington, undrained (5%)**

Generated brief soil descriptions are created for major soil components. The Fallsington, undrained soil is a minor component.

**Map Unit: SacB—Sassafras sandy loam, 2 to 5 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Sassafras (80%)**

The Sassafras component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria.

**Component: Ingleside (10%)**

Generated brief soil descriptions are created for major soil components. The Ingleside soil is a minor component.

**Component: Downer (5%)**

Generated brief soil descriptions are created for major soil components. The Downer soil is a minor component.

**Component: Woodstown (5%)**

Generated brief soil descriptions are created for major soil components. The Woodstown soil is a minor component.

**Map Unit: SacC—Sassafras sandy loam, 5 to 10 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Sassafras (80%)**

The Sassafras component makes up 80 percent of the map unit. Slopes are 5 to 10 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 3e. Irrigated land capability classification is 3e. This soil does not meet hydric criteria.

**Component: Ingleside (10%)**

Generated brief soil descriptions are created for major soil components. The Ingleside soil is a minor component.

**Component: Downer (5%)**

Generated brief soil descriptions are created for major soil components. The Downer soil is a minor component.

**Component: Woodstown (5%)**

Generated brief soil descriptions are created for major soil components. The Woodstown soil is a minor component.

**Map Unit: SaD2—Sassafras sandy loam, 10 to 15 percent slopes, moderately eroded**

**Component: Sassafras (100%)**

The Sassafras component makes up 100 percent of the map unit. Slopes are 10 to 15 percent. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 4e. This soil does not meet hydric criteria.

**Map Unit: SaD3—Sassafras sandy loam, 10 to 15 percent slopes, severely eroded**

**Component: Sassafras (100%)**

The Sassafras component makes up 100 percent of the map unit. Slopes are 10 to 15 percent. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 6e. This soil does not meet hydric criteria.

**Map Unit: SfB—Sassafras loam, 2 to 5 percent slopes**

**Component: Sassafras (80%)**

The Sassafras component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats on coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches

(or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 2e. Irrigated land capability classification is 2e. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Unicorn (10%)**

Generated brief soil descriptions are created for major soil components. The Unicorn soil is a minor component.

**Component: Woodstown (10%)**

Generated brief soil descriptions are created for major soil components. The Woodstown soil is a minor component.

**Map Unit: Sfc2—Sassafras loam, 5 to 10 percent slopes, moderately eroded**

**Component: Sassafras (100%)**

The Sassafras component makes up 100 percent of the map unit. Slopes are 5 to 10 percent. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 3e. This soil does not meet hydric criteria.

**Map Unit: SgC2—Sassafras gravelly loam, 5 to 10 percent slopes, moderately eroded**

**Component: Sassafras (100%)**

The Sassafras component makes up 100 percent of the map unit. Slopes are 5 to 10 percent. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY170MD Well Drained Fine-Loamy Upland ecological site. Nonirrigated land capability classification is 3e. This soil does not meet hydric criteria.

**Map Unit: UbB—Udorthents, borrow area, 0 to 5 percent slopes**

**Component: Udorthents, borrow area (75%)**

The Udorthents, borrow area component makes up 75 percent of the map unit. Slopes are 0 to 5 percent. This component is on borrow pits, flats, uplands. The parent material consists of fluviomarine

sediments fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. Nonirrigated land capability classification is 2e. This soil does not meet hydric criteria.

Component: Udorthents, loamy (10%)

Generated brief soil descriptions are created for major soil components. The Udorthents, loamy soil is a minor component.

Component: Klej (5%)

Generated brief soil descriptions are created for major soil components. The Klej soil is a minor component.

Component: Water (5%)

Generated brief soil descriptions are created for major soil components. The Water soil is a minor component.

Component: Askecksy, drained (5%)

Generated brief soil descriptions are created for major soil components. The Askecksy, drained soil is a minor component.

**Map Unit: WdcA—Woodstown sandy loam, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

Component: Woodstown (80%)

The Woodstown component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY130NJ Moist Loamy Upland ecological site. Nonirrigated land capability classification is 2w. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

Component: Fallsington (6%)

Generated brief soil descriptions are created for major soil components. The Fallsington soil is a minor component.

Component: Hammonton (6%)

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Mattapex (4%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Hambrook (4%)**

Generated brief soil descriptions are created for major soil components. The Hambrook soil is a minor component.

**Map Unit: WdcB—Woodstown sandy loam, 2 to 5 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Woodstown (80%)**

The Woodstown component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY130NJ Moist Loamy Upland ecological site. Nonirrigated land capability classification is 2e. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Fallsington, occasionally ponded (6%)**

Generated brief soil descriptions are created for major soil components. The Fallsington, occasionally ponded soil is a minor component.

**Component: Hammonton (6%)**

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Mattapex (4%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Component: Hambrook (4%)**

Generated brief soil descriptions are created for major soil components. The Hambrook soil is a minor component.

**Map Unit: WscA—Woodstown loam, 0 to 2 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Woodstown (80%)**

The Woodstown component makes up 80 percent of the map unit. Slopes are 0 to 2 percent. This component is on flats, coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY130NJ Moist Loamy Upland ecological site. Nonirrigated land capability classification is 2w. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Hammonton (6%)**

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Fallsington (6%)**

Generated brief soil descriptions are created for major soil components. The Fallsington soil is a minor component.

**Component: Hambrook (4%)**

Generated brief soil descriptions are created for major soil components. The Hambrook soil is a minor component.

**Component: Mattapex (4%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

**Map Unit: WscB—Woodstown loam, 2 to 5 percent slopes, Mid-Atlantic Coastal Plain**

**Component: Woodstown (80%)**

The Woodstown component makes up 80 percent of the map unit. Slopes are 2 to 5 percent. This component is on flats, coastal plains. The parent material consists of loamy fluviomarine deposits. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. A seasonal zone of water saturation is at 24 inches during February. Organic matter content in the surface horizon is about 2 percent. This component is in the F149AY130NJ Moist Loamy Upland ecological site. Nonirrigated land capability classification is 2e. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

**Component: Fallsington (6%)**

Generated brief soil descriptions are created for major soil components. The Fallsington soil is a minor component.

**Component: Hammonton (6%)**

Generated brief soil descriptions are created for major soil components. The Hammonton soil is a minor component.

**Component: Hambrook (4%)**

Generated brief soil descriptions are created for major soil components. The Hambrook soil is a minor component.

**Component: Mattapex (4%)**

Generated brief soil descriptions are created for major soil components. The Mattapex soil is a minor component.

### RUSLE2 Erosion Calculation Record

File: plans\Cal-Maine Foods\_Crawford Farm  
Access Group: R2\_NRCS\_Fld\_Office

#### Inputs:

| Owner name      | Location                  | Info |
|-----------------|---------------------------|------|
| Cal-Maine Foods | USA\Maryland\Cecil County |      |

| R Factor | Annual precip | 10-yr 24-hr rainfall | In Reg area? |
|----------|---------------|----------------------|--------------|
| 170      | 43            | 5.1                  | No           |

| Field name | Soil   | Slope T Value | Slope length, ft | Slope steepness, % |
|------------|--|---------------|------------------|--------------------|
| 4          | soils\SSURGO\Cecil County, Maryland\BuB Butlertown silt loam, 2 to 5 percent slopes\Butlertown Silt loam 65% | 3.0           | 250              | 2.0                |

#### Results:

| Field name | Description  | Contouring system                                  | Support practices | Terrace/diversion system | Cons. plan. soil loss, t/ac/yr | Sed. delivery, t/ac/yr | Soil conditioning index (SCI) | STIR value | Fuel cost |
|------------|--|--|-------------------|--------------------------|--------------------------------|------------------------|-------------------------------|------------|-----------|
| 4          | Cal Maine Foods_Crawford corn gr; nt - soyb, nr; nt, z65 | contour-systems/b. absolute row grade 0.75 percent | -- none --        | -- none --               | 0.32                           | 0.32                   | 0.68                          | 3.5        | 0         |

The SCI is the **Soil Conditioning Index** rating. If the calculated index is a negative value, soil organic matter levels are predicted to decline under that production system. If the index is a positive value, soil organic matter levels are predicted to increase under that system.

The STIR value is the **Soil Tillage Intensity Rating**. It utilizes the speed, depth, surface disturbance percent and tillage type parameters to calculate a tillage intensity rating for the system used in growing a crop or a rotation. STIR ratings tend to show the differences in the degree of soil disturbance between systems. The kind, severity and number of ground disturbing passes are evaluated for the entire cropping rotation as shown in the management description.

# Action Items & Implementation Schedule

## Schedule of Operations

This section describes the practice or action necessary for implementing this comprehensive plan. This element addresses the components and activities associated with the livestock production facility.

### Implementation Schedule for the Farm Operation

*This element addresses the need for and implementation of appropriate conservation practices to meet the quality criteria for soil erosion, air and water quality.*

***IMPORTANT! The table below is your Conservation Practice and Facility Implementation Schedule. All practices have been installed and are being managed appropriately.***

#### Practice and Facility Implementation Schedule

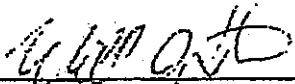

*Complete the table below with those practices that are required to address identified resource concerns. If there are no identified resource concerns which need to be addressed, check the box indicating that there are no practices are recommended.*

- ☒ All resource concerns have been addressed. ALL BMPs associated with the production area and associated facilities, to address these concerns, have been completed and no additional best management practices are recommended or required at this time. *(this item will be checked only after the entire Schedule of Implementation has been implemented and no other resource concerns have been identified)*

#### Schedule of Implementation Agreement

The schedule of conservation practices presented here has been reviewed by the person responsible for compliance with the requirements of the agricultural farm operation.

As the owner/operator, I certify that as the decision-maker, I have been involved in the planning process and agree that the items/practices listed in the table above are needed on my farm operation. I understand that I am responsible for implementing these practices according to the schedule above. Should I not be able to implement any of the above items according to the schedule, I will contact NRCS or my Technical Service Provider and have the schedule revised.

**NUTRIENT  
MANAGEMENT  
PLAN**

## **Nutrient Management**

### **Nutrients (Manure, Wastewater, and Commercial Fertilizers)**

This element addresses the Nutrient Management component of the CNMP. The nutrient management plan is developed by a certified nutrient management consultant, certified by the Maryland Department of Agriculture (MDA). The nutrient management plan is a planning tool to increase the efficiency of all nutrients including manure, wastewater and commercial fertilizer used for crop production, while reducing environmental risk and ultimately increasing profit.

#### **Purpose and Intent of Nutrient Management**

The goal of the Nutrient Management Plan (NMP) is to develop a nutrient budget for nitrogen, phosphorus, and potassium that includes all nutrient sources. From this nutrient budget, projections will be made concerning the sustainability of the plan for the entire crop sequence. In most cases, the nutrient budget is accurate for the first year only. If nutrients from sources not included in this plan and are used in the first year, the nutrient budget will be revised to account for those inputs. In subsequent years considered in this plan, a nutrient budget will be developed using current soil analysis data; current manure analysis data; the actual crops to be used and their projected yields and nutrient needs and will account for nutrients from all sources. Guidance in developing a nutrient budget may be obtained from your NRCS Field Office or your University of Maryland Cooperative Extension Service Agent. Land application procedures must be planned and implemented in a way that minimizes potential adverse impacts to the environment and public health.

#### **Nitrogen and Phosphorus Transport and Water Quality Impairment**

The potential for plant nutrients to migrate to surface and groundwater is largely depending upon soil and site conditions. Any combination of soil/site conditions that leads to rapid runoff of rapid movement of rainfall through the soil will lead to water quality risks from almost any land use practice. Excessive Nitrogen and Phosphorus concentrations in surface waters generally affect water quality by supplying nutrients to phytoplankton, which are small aquatic plants that grow suspended in water and include various types of algae. The same forms of these nutrients, which are available to crops, are also available to phytoplankton. Taste and odor problems often occur in drinking water because of excessive algae blooms in surface water.

Most annual cropping systems show a direct and marked yield response to fertilizer N applied to non-legume crops. While leaching losses are the major environmental threat from N, runoff losses are also possible. The potential for each system to contribute N to surface waters will be directly dependant upon its erosion potential coupled with fertilizer application practices. Nitrogen is lost to surface waters primarily from recently applied inorganic fertilizers. The major water quality concerns associated with

land application of organic wastes is the direct runoff of the organic material into surface waters and then migration to groundwater.

Phosphorus is the second major element utilized by actively growing plants but differs from Nitrogen. P is very immobile in soil and seldom migrates downward because it is strongly absorbed by the soil particle. The risk of groundwater contamination by P from crop production systems is limited, however the solid forms of P that accumulates in surface soil are subject to loss via erosion. Runoff losses to surface waters are the major water quality risk from P. Where erosion risk increases, such as for annual crops with conventional tillage, the total P loss increases greatly as the P is moved in solid form with the eroding soil.

### **Nutrient Management Plan**

The Nutrient Management Plan describes a nutrient budget for nitrogen, phosphorous and potassium that considers all potential sources of nutrients including (but not limited to) animal manure, organic by-products, wastewater, commercial fertilizer, crop residues, legume credit and irrigation water. The NMP is developed by an MDA certified nutrient management consultant who has the education and experience to formulate field-specific nutrient recommendations based on field histories, soil and manure test data, realistic yield expectations, crop nutrient requirements, preferred nutrient sources and timing and method of nutrient application.

#### **Plan Maintenance, Updates or Revisions**

According to MDA, NMP's must be updated before they expire or at least once every 3 years. The NMP should be updated each year to account for any factors such as: changes in crop rotation, legume and/or manure Nitrogen credits and changes in the amount of manure generated. Changes in your agricultural operation may require you to modify or update your plan sooner. Your Nutrient Management Plan should be updated if any of the following situations occur:

1. A change to the planned crop or cropping rotation or introduction of new crop not currently addressed in this nutrient management plan, unless the new crop will have fertility management similar to that originally planned.
2. A change of nutrient source or soil test results that indicate a change in nutrient recommendations.
3. A change in acreage managed of 10 percent or greater, or 30 acres, whichever is less.
4. A change in animal units of 10 percent or greater if resultant manure production will require significant management adjustments.

#### **Nutrient Management Plan Annual Implementation Report**

The Maryland Department of Agriculture requires that all farm operators submit an Annual Nutrient Application Annual report on all farm(s) under the Nutrient Management Plan. For information

regarding the Annual Report submittal requirements and time-frame contact your Regional Nutrient Management office or Maryland's Nutrient Management Program at 410-841-5959.

**Minimum Setback Distances from Sensitive Areas**

| Type of Sensitive - Setback Area   | Setbacks based on Methods of Applications                                |  | Notes |
|--|--|--|-------|
|  | Surface Application  | Surface Incorporation w/in 24 Hours                                      |       |
| Residence/Business/Property Lines  | 100 ft (or alternative w/ the consent of adjacent property owner)        | 100 ft (or alternative w/ the consent of adjacent property owner)        |       |
| Sinkholes  | 100 ft   | 100 ft   |       |
| Perennial/Intermittent Streams & Ditches; Pond or Lake   | 100 ft, or use a minimum 35 ft vegetated buffer strip adjacent to stream | 100 ft, or use a minimum 35 ft vegetated buffer strip adjacent to stream |       |
| Grassed Waterway   | 35 ft  | 35 ft  |       |
| Private Well and Springs   | 100 ft   | 100 ft   |       |
| Public Well  | 200 ft   | 200 ft   |       |
| Public Surface Drinking Water Intake   | 200 ft   | 200 ft   |       |
| Field application of animal waste shall not take place on frozen ground or snow covered ground without written permission from the Department; which may be granted if an imminent storage failure or other dire emergency exists. |  |  |       |
| An Animal Feeding Operation (AFO) will maintain a setback of 100' or a 35' vegetated filter strip between stored manure (which includes crust-outs and poultry litter) and waters of the state, including field ditches.           |  |  |       |

No specific criteria, see NMP for application rates and details.

### Field or Management Unit Specific Information

1. Source and type of info. used to determine crop yield \_\_\_\_\_
2. Method of tillage (moldboard, chisel, no-till, etc.) \_\_\_\_\_
3. Recommendations for calibrating application equipment \_\_\_\_\_
- ☐ 4. Soil analysis for fields or mgmt. units \_\_\_\_\_
5. Phosphorus risk assessment:
  - a) type of assessment and results \_\_\_\_\_
  - b) recommendation for BMPs to lower risk \_\_\_\_\_
6. Residual nitrogen (legumes, past applications of past manure/biosolids/etc.) & PSNT Info. \_\_\_\_\_
7. ID, field or mgmt unit identifier and acreage/growing area \_\_\_\_\_
8. Crop Rotation(s), expected crop yield, and primary nutrient requirements \_\_\_\_\_

### Additional Plan Content for Container or Out-of-Ground Production

1. List of plants to be grown, est. greatest # of plants, and total growing area \_\_\_\_\_
2. Summary of production and respective container sizes \_\_\_\_\_
3. Month or time frame of peak production \_\_\_\_\_
4. Description of substrate, irrigation, and nutrient application method \_\_\_\_\_
5. Environmental Risk Assessment \_\_\_\_\_
6. Program and recommendations for monitoring runoff \_\_\_\_\_
7. Methods for sampling and testing runoff \_\_\_\_\_
8. Required best management practices and/or specific recommendations \_\_\_\_\_

### ☐ Map(s) of the Agricultural Operation

1. Location and boundaries of ag. operation w/field or mgmt unit boundaries \_\_\_\_\_
2. Parcel identifier, field identifier, and acreage of fields or mgmt units \_\_\_\_\_

### ☐ Summary of Nutrient Recommendations

1. Miscellaneous notes in regards to nutrient application \_\_\_\_\_
2. Nutrient Recommendations \_\_\_\_\_

(A snapshot which includes parcel ID, field or mgmt unit identifier, crop/plant yield/production goal, acreage/growing area, recommended nutrient rates necessary to meet expected crop yields (amount and type of all nutrient sources per acre or mgmt unit), method and time frame for nutrient application and incorporation, and liming recommendations)

## Certification and Review

### Planner

I certify that this plan has been written according to the Maryland Nutrient Management Certification Regulations and that I am a certified planner in the State of Maryland.

Name of planner: Don Moore  
AET Consulting, Inc.

Certification Number: MD-1048  
License Number: MD-2175

Planner Signature: 

Date: 4-9-25

### Certification of Plan Review

This is to certify that this plan has been reviewed and has been found to be accurate and true according to my knowledge. It is mutually understood that this plan, when implemented, will serve as a guide for applications of fertilizers according to soil test results included in this plan. It is also understood that implementation of this plan will help to protect surface and groundwater resources.

Farm Owner/Operator: 

Farm Operations Manager

This Nutrient Management Plan was written as an export plan for the animal manure. All the layer and pullet manure produced is removed from the farms and exported to various farming operations. Earthen lagoons are located on the layer farms to hold egg wash water. This water from Crawford farm processing facility and the Redbird facility is relocated and spray irrigated on cropland operated by adjacent farmer. Discharge permits are maintained for these farms. This plan was developed in January and will cover a one year time period.

Although Cal- Maine Foods does not operate the crop fields receiving the wash water, we are including them in this plan because they are receiving waste water from the egg wash operation.

## Plan Maintenance

This plan was written for a one year time period. After this time the plan will need to be updated. In addition, if any of the following events occur the plan will need to be updated before the plan expiration date.

1. Changes in animal unit numbers or changes in housing of animals on the farm.
2. Changes in manure storage.
3. Change in manure receivers.

136

Record keeping is very important for compliance to the Maryland Nutrient Management laws. A simple record sheet is included to keep track of amounts and recipients of manure produced on this farm. The operator is encouraged to use this sheet and keep it with this plan for easy reference.

| 2024/2025 Manure Receivers |   |   |               |

## Manure Management

| Animal Type            | Number of Animals | Total Generated | Total Collected | Total Used |                          | Total Exported |
|------------------------|-------------------|-----------------|-----------------|------------|--------------------------|----------------|
|                        |                   |                 |                 | Rate/Ac    | Field                    |                |
| Wash water Crawford    | NA                | 3,039,763gal    | 1,228,669gal    | 10,000gal  | Crawford: 4,6,7          | NA             |
| Wash water Walnut Tree | NA                | 3,039,763gal    | 556,200gal      | 8,000gal   | Walnut Tree: 1,2,3,4,5,6 | NA             |

Above ground  
lagoon

old company 6 is  
warwick North  
old company 15 is  
warwick South

Currently there is an above ground storage tank and an earthen lagoon functioning in this operation. Samples are taken from each, and the results are included in this plan. The results of the Crawford sample indicated an available nitrogen value of 1.6lbs/ 1,000 gallons. The phosphorus results averaged .40 lbs of P2O5 per 1,000 gallons. The potassium results averaged .3 lbs of K2O per 1,000 gallons. The results of the Walnut Tree sample indicated .77lbs/1,000 gallons of available nitrogen, .43lbs of P2O5 per 1,000 gallons, and .19lbs of K2O per 1,000gallons.

The old Company 6 and Company 15 lagoons do not directly receive processing waste water any longer. A new egg production facility has been built, along with a new above ground tank on the Crawford farm next to the fields receiving the water. Starting in 2021 an overhead irrigation pivot is utilized to apply the water.

When wash water is applied on the Crawford farm at 10,000gal/ acre it will provide a nutrient content of 16-4-3. When wash water is applied on the Walnut Tree farm at 8,000gal/ acre it will provide a nutrient content of 6-3-1. Water is diluted with fresh water when irrigating. Multiple applications are made during the growing season, a spring, fall, and a summer application.

## Best Management Practices

Best management practices could be added to the farming operation. Manure application equipment should always be calibrated at the onset of application to better gage the application rate per acre. Manure should be sampled at the time manure is being removed at least every 2 years until a base line of nutrient content is established.

Immediate incorporation would make the most efficient use of nitrogen. Immediate incorporation would also reduce odor and fly problems.

\*These totals are taken from the Poultry Litter Quantity Estimation sheet. Because of manure management, actual manure removed totals 28,646 tons per ISE records of manure exported. This number is lower than normal because farm is still rebuilding from AI Depopulation.

### Warwick North-

Houses #1 to #7 sized 52X530. Manure storage is in a pit under the birds with an area of 52X530. Manure is exported annually.

House #8 (est 52'x530') may be rebuilt on existing building pads at a future date. Manure will be exported annually.

### Warwick South-

House #4, #7, #8, #9 sized 56X412. Manure is removed daily to an attached storage building sized 56X110. Manure is exported annually.

Houses #2, #3 sized 54X375. Manure is removed daily to an attached storage building sized 54X130. Manure is exported annually.

Houses 1 & 5 (est 52'x530') may be rebuilt on existing building pads at a future date. Manure will be exported annually. A hoop structure is located on this farm for manure storage. This structure is 50ft by 320ft with 24 ft center eave height

### Warwick Pullet-

Houses #1, #2 sized 55X446. Manure is removed daily to a central storage building sized 52x400. Manure is removed annually and exported.

Middle House is utilized as a manure storage barn.

### Millington-

Houses #1 to #4 sized 54X375. Manure is removed daily to an attached storage building sized 54X130. Manure is removed as needed and exported by Lewis McDonald.

Earthen lagoon 80X135 with a total of 593,669 gal wash water is produced at this facility. For Houses #5-7, no future plans to rebuild are proposed on these existing building pads.

### Millington Pullet-

Houses #1, #2 sized 52X412. Manure is removed from the houses daily to the detached storage building sized 60X120. Manure is removed as needed by Lewis McDonald.

Middle House is utilized as a manure storage barn.

The processing facility for farms 6 and farm 15 is located on the Crawford farm. An above ground concrete tank stores all wash water. Layer farm #2 has an earthen lagoon for storage of wash water. All water is pumped out and transported to a neighboring farmer who applies to crop fields via overhead pivot irrigation. Care is taken to avoid ponding and rain events, etc. per the discharge permit. These farms have discharge permits with MDE and quarterly, pump out volumes are reported. Twice per year nutrient analyses of the water are taken.

**Manure Management Practices:**

- Mortality disposal method: ☒ compost; ☐ incinerate; ☐ render; ☐ other
- If the waste was stored following removal from the production facility, identify the storage method(s) prior to transport off the farm:
  - Permanent systems:** ☒ waste storage structure; ☒ outside, uncovered storage; ☐ outside, covered storage; ☒ Other—manure is stored within the house
  - Temporary storage:** ☐ outside, uncovered storage; ☐ outside, covered storage.
- Is a manure storage site provided on the farm? ☒ Yes ☐ No

It is recommended that the receiving operation has:

1. A current approved Nutrient Management Plan.
2. An approved method or structure to properly store the manure until land application can be completed.
3. A soil test phosphorus level of less than 150 FIV based on a soil test taken within the past three years.
4. Covered trucks for any over-the-road transport.

Storing manure in a permanent roofed storage structure is the best storage option. On farm storage in the production area (i.e. at the end of the poultry houses) is limited to 14 days without being covered or being stored in an approved structure. The stockpile must be separated from any channeled runoff, standing water, and other drainage systems such as roof runoff and down spouts. If stored outside less than 14 days, the stockpile must be at least 6 feet high and on an impermeable base pad constructed in accordance with NRCS conservation practice standard, Heavy Use Area Protection, Code 561.

Best Management Practices (BMPs) are a good addition to any operation. **Record Keeping** is an important and useful practice that should be considered. You are required to keep records of manure recipients but also recording actual flock numbers and actual manure tonnage produced would be beneficial information in creating an even more precise Nutrient Management Plan.

**Storm Water Management** is another BMP that could be used. Keeping excess moisture diverted away from the manure shed and composters helps to reduce nutrients from moving off site. This benefits water quality for you and your neighbors.

## Animal Mortality Disposal

Dead animals shall be disposed of in an environmentally safe manner, according to all federal, state, and local laws and regulations. Mortality is composted within the houses. In the event of a catastrophic animal mortality, by any cause, including loss by disease, contact your contract poultry company before beginning carcass disposal.

One option for handling large animal mortality is composting. For heat, storm, power loss, and other non-pathogenic loss of animals, composting can be accomplished outside. Composting is preferred for low path avian influenza and for high pathogenic loss such as H5 or H7 Avian Influenza.

Composting material needs include:

- Mortality
- Wood shavings, straw, or sawdust (high C:N ratio) that will serve as a base for the composting pile. It will also act as an insulating blanket that surrounds the outside of the composting animal mortality, sustaining temperatures. If there is an excess of poultry litter on the farm, the outside of the windrows could be substituted with poultry litter, when covered with compost fleece.
- Material that initiates the composting process is referred to as the "feedstock". The feedstock can be corn silage, chicken litter, sawdust, shavings, wood chips, mulch, compost, etc, or a mixture of these materials. Composting conditions require 50-60% moisture content, a feedstock carbon to nitrogen ration between 20:1 and 40:1, and adequate oxygen. Test the moisture in the feedstock by grabbing a handful of the material and squeezing it into a ball. If it holds together when you release the pressure, it is good. If you can squeeze moisture from the ball, it is too wet. If it falls apart, water needs to be added. When dealing with broilers and dry chicken manure in a catastrophic event, adding water is not an option. Moisture will come from selection of feedstock and carcasses as they compost.

Outside composting:

- Choose a well-drained site, when possible. Follow the same distance required from wells, streams, and ditches as the state requires for rural septic systems. You must have an appropriate site or all-weather road to get to the approved site.
- Piles need to be structured in a pyramid fashion with rounded top to shed water. They will average 15 feet wide and not exceed 7.5 feet in height.
- When building the pile, start by placing a 5-6 inch depth base of wood chips, wood shavings or sawdust, approximately 18 feet wide and as long as needed, as a good base. The base will act as an insulating material and adsorbent.
- For composting chickens, mix the feedstock and birds together and place on top of the base to a maximum of 7 feet in height. Cover the top and sides of the pile with 5-6 inches of wood chips, wood shavings, sawdust, or clean poultry litter (not contaminated with carcasses). Then cover with compost fleece. Again the carbon material acts as an insulator and fleece helps keep the area secure. Piles must reach and sustain temperature of at least 131 degrees for three consecutive days to kill pathogenic disease organisms.
- Secure with perforated tires. Tucking the outside edge of the cloth in the ground and/or placing soil where the edges of the cloth come in contact with the ground will provide added security from the wind, protect rodents, animals, and avian wildlife from visiting the pile, and shed excess water.
- Insert compost thermometers with approximately 36 inch probes, into the pile to measure temperatures.
- Piles should be turned no sooner than 2 weeks but at least once after the composting process is initiated.

1. Yield goal based on past history.

2. Egg wash waste water provides 5-2-1 when applied at 8,000gal, and 14-3-3 when applied at 10,000gal.

3. Nitrogen credit includes current and past manure applications as well as previous legume crop.

4. No starter applied.

5. Additional Fertilizer-

Corn- Broadcast recommended fertilizer where indicated prior to planting. Split apply indicated nitrogen with herbicides and at sidedress.

Alfalfa and other legumes - It is recognized by both the planner and the grower that nitrogen is not needed for these crops. The fertilizer blend used had the lowest possible nitrogen value while still providing other nutrients needed by the crop.

## Feed Management Considerations

Feed management activities may be used to reduce the nutrient content of manure, which may result in less land being required to effectively utilize the manure. Feed management activities may be dealt with as a planning consideration and not as a requirement that addresses specific criteria; however, AFO owners/operators are encouraged to incorporate feed management as part of their nutrient management strategy. Specific information and recommendations should be obtained from Land Grant Universities such as the University of Maryland, the Agricultural Research Service, or professional societies such as the Federation of Animal Science Societies (FASS) or American Registry of Professional Animal Scientists (ARPAS), or other technically qualified entities. Specific feed management activities to address nutrient reduction in manure may include phase feeding, amino acid supplemented low crude protein diets, and the use of low phytin phosphorus grain and enzymes, such as phytase or other additives. Feed management can be an effective approach to addressing excess nutrient production and should be encouraged; however, it is also recognized that feed management may not be a viable or acceptable alternative for all AFO. A professional animal nutritionist should be consulted before making any recommendations associated with feed ration adjustment.

## Other Utilization Activities

If this element of the CNMP should be presented as a consideration for the AFO owner and/or operator in his/her decision-making process, a statement of action would be presented below in a table format.

Using environmentally safe alternatives to land application of manure and organic by-products should be an integral part of the overall CNMP. Alternative uses for animal manure are needed in areas where nutrient supply exceeds the nutrient requirements of crops, and/or where land application would cause significant environmental risk. Manure use for energy production, including burning, methane generation, and conversion to other fuels, is being investigated and even commercially tested as a viable source of energy. Methods to reduce the weight, volume, or form of manure, such as composting or pelletizing, can reduce transportation cost, and create a more valuable product. Manure can be mixed or co-composted with industrial or municipal by-products to produce value-added material for specialized uses. Transportation options are needed to move manure from areas of over supply to areas with nutrient deficiencies (i.e., manure brokering).

**REQUIRED RECORD KEEPING  
& Nutrient Management Requirements**

*(SEE THE TEMPLATES  
WHICH FOLLOW)*

## Record Keeping

It is important that records are kept to effectively document and demonstrate implementation activities associated with CNMPs. Documentation of management and implementation activities associated with a CNMP provides valuable benchmark information for the producer that can be used to adjust his/her CNMP to better meet production objectives. It is the responsibility of AFO owners/operators to maintain records that document the implementation of CNMPs.

CNMP requires that the producer maintain these records for no less than 5 years. Maryland State regulations require that the Nutrient Management Plan records be maintained for a minimum of 5 years as well (see Maryland State Nutrient Management Requirements of this section). It is the producer's responsibility to ascertain the minimum time required for archiving the records listed below. In some cases, if certain USDA programs are in effect, the records may need to be kept as long as fifteen years. In addition, if this operation requires a CAFO permit, annual reporting may be necessary.

Records may be kept in a number of ways:

- Record Forms are available from the NRCS.
- Record forms may be obtained from University of Maryland Extension Office or from the MDA Nutrient Management Program.
- You may develop your own records system provided that all necessary information is included.

### Land Application Record Keeping.

#### Record Keeping (Maintain for 5 years)

Maintaining records to document plan implementation. As applicable, records include:

- ☐ Soil test results and recommendations for nutrient application.
- ☐ Quantities, analyses and sources of nutrients and manure applied.
- ☐ Manure Transfer/Export Events
- ☐ Dates and methods of nutrient and manure applications.
- ☐ Crops planted, planting and harvest dates, yields, and crop residues removed.
- ☐ Results of water, plant, and organic by-product analyses.
- ☐ Dates of review and person performing the review, and recommendations that resulted from the review.

### Operation and Maintenance

- a. Review the Manure and Nutrient Management Plan component annually and make adjustments when needed.
- b. Calibrate application equipment to ensure uniform distribution and accurate application rates (SEE SECTION 13).

- c. Inspect and repair manure hauling and application equipment to minimize potential of accidental spillage.
- d. Protect fertilizer storage areas from weather to minimize runoff, leakage, and lost of material.
- e. Avoid unnecessary exposure to fertilizer and organic waste (bio-solids), and wear protective clothing when necessary.
- f. Observe set backs required for nutrient applications (specified in this plan) adjacent to water bodies, drainageways, sink holes, and other sensitive areas.
- g. Maintain records of manure and nutrient applications for 5 years (SEE SECTION 6).
- h. Clean up residual materials from equipment and dispose of properly.

### Summary:

The development of this Plan only applies to the fields and conditions stated in the Plan. If changes occur in your livestock operations or fields contact the NRCS/SWCD Office or your Technical Service Provider to get this Plan revised.

### Documentation of Records

The Table below shows which of the CNMP records which may be required by MD NRCS. Operators should maintain these records to document plan implementation. As applicable, records include:

| Item   | Report Details  | Frequency     | Documentation                                   | Maryland Records Kept For: | Required by MD NRCS? |
|--|---|---------------|---|----------------------------|----------------------|
| Monthly Animal and Mortality Count                                   |   | Monthly       | Suggested format available                      | 5 Years                    | Y                    |
| Calibration Record for Spreading Equipment                           |   | Annually      | Suggested format available                      | Two Most Recent Records    | Y                    |
| Soil test results  |   | Every 3 years | Keep Soil Test Reports                          | 5 Years                    | Y                    |
| Results of Pre-Side Dress Nitrogen or Pre-Plant Soil Nitrate Testing | Any alternative sampling technique used to address specific crop requirements that lead to a change in the applied amounts should be documented.        | As needed     | Keep Test Reports                               | 5 Years                    | Not Required         |
| Plant Tissue Testing Results   | If analysis is used in allocation decisions these results should be maintained  | As needed     | Keep Test Reports                               | 5 Years                    | Not Required         |
| Manure Nutrient Analysis   | A manure analysis should be completed annually, for each manure storage containment and prior to application. It is essential that a recent analysis be | Annual        | Suggested format available or Keep Test Reports | 5 Years                    | Y                    |

## Maryland Department of Agriculture Nutrient Management Requirements

### Plan Implementation Records

MDA may periodically review the records of your agricultural operation. Regulations supporting the *Water Quality Improvement Act of 1998* outline the process for the evaluation and implementation of a nutrient management plan. Maintaining records to document plan implantation is the responsibility of the operator. Listed below are items needed for a Maryland Nutrient Management (on-farm) inspection of your nutrient management plan:

- ☐ All nutrient management plans and updates for the past 3 years.
- ☐ A record of crops and actual yields for the past 5 years.
- ☐ Analysis of nutrients (all forms) applied to plants and/or crop acreage.
- ☐ Soil/Manure analysis results for the entire agricultural operation.
- ☐ Receipts related to the purchase of nutrients.
- ☐ Documentation of when and where nutrients were applied to specific fields; in reference to amounts; farm, field and location.
- ☐ Documentation to justify any changes from the nutrient management plan as written.

### Nutrient Management Plan Annual Implementation Report

The Maryland Department of Agriculture requires that all farm operators submit an Annual Nutrient Application Annual report on all farm(s) under the Nutrient Management Plan. For more information regarding the Annual Report submittal requirements and time-frame, contact Maryland's Nutrient Management Program at 410-841-5959.

### Nutrient Applicator Voucher

If operator is an applicator of nutrients of 10 or more acres; the operator must possess a CURRENT Maryland Nutrient Applicator's Voucher or be a Certified Nutrient Management Consultant. For more information regarding applicator voucher requirements, contact Maryland's Nutrient Management Program at 410-841-5959.

## **Manure Analysis Sampling Procedures**

### **Solid Manure (Dairy, Beef, Swine, Poultry)**

Collect a composite sample by following one of the procedures listed below. A method for mixing a composite sample is to pile the manure and then shovel from the outside to the inside of the pile until well mixed. Fill a one-gallon plastic heavy-duty zip lock bag approximately one-half full with the composite sample, squeeze out excess air, close and seal. Store sample in freezer if not delivered to the laboratory immediately.

**Procedure 1. Sampling while loading** - *Recommended method for sampling from a stack or bedded pack.* Take at least ten samples while loading several spreader loads and combine to form one composite sample. Thoroughly mix the composite sample and take an approximately one pound sub sample using a one-gallon plastic bag. *Sampling directly from a stack or bedded pack is not recommended.*

**Procedure 2. Sampling during spreading** - Spread a tarp in field and catch the manure from one pass. Sample from several locations and create a composite sample. Thoroughly mix the composite sample together and take a one-pound sub sample using a one-gallon plastic bag.

**Procedure 3. Sampling daily haul** - Place a five-gallon bucket under the barn cleaner 4-5 times while loading a spreader. Thoroughly mix the composite sample together and take a one-pound sub sample using a one-gallon plastic bag. Repeat sampling 2-3 times over a period of time and test separately to determine variability.

**Procedure 4. Sampling poultry in-house** - Collect 8-10 samples from throughout the house to the depth the litter will be removed. Samples near feeders and waterers may not be indicative of the entire house and sub samples taken near here should be proportionate to their space occupied in the whole house. Mix the samples well in a five-gallon pail and take a one-pound sub sample, place it in a one-gallon zip lock bag.

**Procedure 5. Sampling stockpiled litter** - Take ten sub samples from different locations around the pile at least 18 inches below the surface. Mix in a five-gallon pail and place a one-pound composite sample in a gallon zip lock bag.

### **Sample Identification and Delivery**

Identify the sample container with information regarding the farm, animal species and date. This information should also be included on the sample information sheet along with application method, which is important in determining first year availability of nitrogen.

Keep all manure samples frozen until shipped or delivered to a laboratory. Ship early in the week (Mon.-Wed.) and avoid holidays and weekends.

## **Nutrient Application Equipment Calibration:**

### **Commercial Fertilizer Application Equipment Calibration:**

The nitrogen applicator, the commercial broadcast spreaders, and corn planter will be set per the manufacturers recommendations then filled with a known amount and checked over known acreage. Adjustments will be made to achieve the planned rates.

### **Manure Spreader Calibration**

There are several methods that can be used to calibrate the application rate of a manure spreader. The two best methods are the load-area method and the plastic sheet method. It is desirable to repeat the calibration procedure 2 to 3 times and average the results to establish a more accurate calibration.

Before calibrating a manure spreader, the spreader settings such as splash plates should be adjusted so that the spread is uniform. Most spreaders tend to deposit more manure near the spreader than at the edge of the spread pattern. Overlapping can make the overall application more uniform. Calibrating of application rates when overlapping requires measuring the width of two spreads and dividing by two to get the effective spread width.

Calibration should take place annually or whenever manure is being applied from a different source or consistency.

### **Load-Area Method**

The load-area method is the most accurate and can be used for most types of manure handling. This method consists of determining the amount (volume or weight) of manure in a spreader and the total area over which it is applied. The most accurate method to determine the amount of manure in a spreader is to weigh the spreader when it is full of manure and again when it is empty (portable pad scales work well for this). The difference is the quantity of manure applied over the area covered. Spreader capacities listed by the manufacturers can be used to determine the amount of manure in the spreader. However care must be taken when using manufactures spreader capacities. Heaped loads, loading methods and manure type may vary considerably from what is listed by manufacturers of box and side delivery manure spreaders. Spreader capacities for liquid tankers are accurate provided the tanker is filled to the manufactures recommended levels, and no foam is present in the tank.

The area of spread is determined from measuring the length and width of the spread pattern. Measuring can be done with a measuring wheel, measuring tape or by pacing.

The application rate is calculated using the following formula:

Spreader capacity (tons or gallons) X 43560 sq. ft/acre = Application Rate tons or Gallons/Acre

Distance traveled X Spreading width

### **Plastic Sheet Method**

The plastic sheet method can only be used with solid or semi-solid manure. This method of calibrating spreader application rates involves 1) cutting a plastic sheet to the specified dimensions (56 inches X 56

inches), 2) weighing the clean plastic sheet, 3) laying out the plastic sheet on the ground and driving the manure spreader (applying manure at a recorded speed and spreader setting) over the sheet, 4) weighing the plastic sheet with the manure on it, and 4) determine the net weight of the manure on the sheet (weight of manure and sheet - weight of the clean sheet), and 5) the net pounds of manure equals tons per acre applied.

When calibrating manure spreaders, all details regarding tractor speed and manure spreader settings and date(s) of each calibration should be recorded with manure application information, and directly on the equipment. Mark equipment to ensure a known application rate is applied each time the referenced tractor speed and spreader settings are used. Manure spreader settings can include such things as: fast and slow settings on some box spreaders, gate position on side delivery spreaders and splash plate position and fill levels on liquid tankers.

### **Irrigation System Calibration:**

Place 3-5 buckets throughout the irrigation spray pattern and collect samples while operating the pump at a given rpm and pressure (for a traveling gun record the ground speed also). At the end of the planned sample period measure the amount of liquid collected in inches (average the samples). The following chart shows how many gallons per acre applied per inch applied.

Gallons applied per inch of liquid manure applied.

| Inches Liquid Manure Applied via Irrigation | Gallons per Acre |
|---|------------------|
| .20   | 5,430            |
| .30   | 8,146            |
| .40   | 10,860           |
| .50   | 13,577           |
| .75   | 20,365           |
| 1.0   | 27,154           |
| 1.25  | 33,942           |
| 1.5   | 40,731           |

**Manure, Litter, and Wastewater Storage Structures Documentation**

Facility Name: \_\_\_\_\_ NPDES Permit No.: \_\_\_\_\_

**Instructions:**

For each storage structure, provide the following information in the table below:

- **Structure Type:** the type of storage structure (e.g. roofed storage shed, storage pond, anaerobic lagoon...)
- **Total Design Storage Volume:** the total capacity the storage structure was designed to hold (e.g. 100 ft<sup>3</sup> or 1000 gallons)
- **Design Treatment Volume:** (\*N/A for dry manure storage) the treatment capacity the structure was designed to treat
- **Days of Storage Capacity:** (\*N/A for dry manure storage) the number of days the structure can accommodate its contents at the rate the operation places waste in it
- **Volume for Solids Accumulation:** the capacity of the structure available to accumulate solids

| Structure Type | Total Design Storage Volume | Design Treatment Volume<br>(N/A for dry manure storage) | Days of Storage Capacity<br>(N/A for dry manure storage) | Volume for Solids Accumulation |
|----------------|-----------------------------|---|--|--------------------------------|
|                |                             |   |  |                                |

**Manure, Litter, and Wastewater Transfer Record Keeping Form**

Facility Name: \_\_\_\_\_ NPDES Permit No.: \_\_\_\_\_

Use this sheet any time that manure or poultry litter is removed from a production or storage area and transferred to other persons (not under the control of your CAFO). Use additional sheets as necessary.

| Date of Transfer<br>(indicate whether<br>import or export) | Manure Type<br>(e.g. litter,<br>wastewater) | Name and Address of Person(s) Received From or Transferred To | Quantity<br>Transported<br>(tons/gallons) |

**Nutrient Land Application Log Sheet**

Facility Name: \_\_\_\_\_ NPDES Permit No.: \_\_\_\_\_

**Instructions:**

For each land application for each field, provide the following information in the table below:

- **Date:** the date you applied the manure/litter/process wastewater to the field
- **Field ID:** the field where you applied manure/litter/process wastewater. Use the same field identification that is used in your nutrient management plan
- **Method:** how you applied the manure/litter/process wastewater (e.g. surface w/incorporation, surface w/out incorporation, subsurface injection...)
- **Application Rate:** the number of tons or gallons *actually* applied per acre
- **Acres Applied:** the number of acres the manure/litter/process wastewater was applied to on the field
- **Total N:** the total amount of nitrogen you applied to the field from animal waste
- **Total P:** the total amount of phosphorous you applied to the field from animal waste

| Date | Field ID | Method | Actual Application Rate | Acres Applied | Total N | Total P |
|------|----------|--------|-------------------------|---------------|---------|---------|
|      |          |        |                         |               |         |         |
|      |          |        |                         |               |         |         |
|      |          |        |                         |               |         |         |
|      |          |        |                         |               |         |         |

| Date | Field ID | Method | Actual Application Rate | Acres Applied | Total N | Total P |
|------|----------|--------|-------------------------|---------------|---------|---------|
|      |          |        |                         |               |         |         |

|      |          |        |                         |               |         |         |
|      |          |        |                         |               |         |         |
|      |          |        |                         |               |         |         |
|      |          |        |                         |               |         |         |
|      |          |        |                         |               |         |         |

### Weather and Soil Condition Documentation

When land applying manure/litter/process wastewater, you also need to document the weather and soil conditions. Please provide this information in the following table:

| Date | Field ID | Weather Conditions |        |                | Soil Conditions |
|------|----------|--------------------|--------|----------------|-----------------|
|      |          | 24 hours before    | During | 24 hours after |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |
|      |          |                    |        |                |                 |

### Weekly Storage and Containment Structure Inspections Log Sheet

Facility Name: \_\_\_\_\_ NPDES Permit No.: \_\_\_\_\_

#### Instructions:

Use this form to keep records of weekly visual inspections of the structures you use to store or contain manure/litter/process wastewater. Use a separate form for each structure.

*\*Any deficiencies observed must be corrected within 30 days*

Storage or Containment Structure: \_\_\_\_\_

|        | Date | Initials | Depth<br>Marker<br>Reading<br>(N/A<br>for dry<br>manure<br>handling) | OK<br>(✓ if no<br>problems) | Description of any Deficiencies<br>Observed<br>(put "N/A" if none observed) | Date<br>Deficiency<br>Corrected* |

## Weekly Wastewater Facilities Inspections Log Sheet

Facility Name: \_\_\_\_\_ NPDES Permit No.: \_\_\_\_\_

### Instructions:

Use this form to keep records of weekly visual inspections of your wastewater facilities (including pumps, storm water and runoff diversion devices, and devices used to channel contaminated storm water to a wastewater storage or containment structure).

*\*Any deficiencies observed must be corrected within 30 days*

List the items that need to be inspected below:

|       |       |
|-------|-------|
| _____ | _____ |
| _____ | _____ |
| _____ | _____ |
| _____ | _____ |

|           | Date | Initials | OK<br>(√ if no<br>problems) | Description of any Deficiencies<br>Observed<br>(put "N/A" if none observed) | Date<br>Deficiency<br>Corrected* |
|-----------|------|----------|-----------------------------|---|----------------------------------|
| Week<br>1 |      |          |                             |   |                                  |
| Week<br>2 |      |          |                             |   |                                  |

### AFO RESOURCE CONCERNS EVALUATION WORKSHEET

| Name:   | Cal-Maine Foods, Inc.    | Agency Interest #:                  | 22189   |
|---|--------------------------|-------------------------------------|---|
| Planner:  | David D. Kann            | Farm # / Tract #:                   | Warwick North   |
| Site Visit Date:                                | 08/23/2024               | Total Acres:                        | 152 *Acres for egg wash spray fields (all associated cropland is leased out)  |
| County:   | Cecil                    | Production Area Acres:              | 16 acres  |
| RESOURCE CONCERN                                | YES                      | NO                                  | ASSESSMENT  |
| a. Biosecurity measures                         | <input type="checkbox"/> | <input checked="" type="checkbox"/> | All precautionary measures are in place and being followed. Visitor restrictions.   |
| b. Chemical handling                            | <input type="checkbox"/> | <input checked="" type="checkbox"/> | All chemicals are stored in an appropriate designated storage area.   |
| c. Cultural resources                           | <input type="checkbox"/> | <input checked="" type="checkbox"/> | The production area is established and there are no proposed ground disturbance activities scheduled for the area.  |
| d. Feedlot area                                 | <input type="checkbox"/> | <input checked="" type="checkbox"/> | N/A   |
| e. Floodplains                                  | <input type="checkbox"/> | <input checked="" type="checkbox"/> | This is an existing operation and the production area is not located in the FEMA-100 year floodplain as per online mapping resources.   |
| f. Gully erosion                                | <input type="checkbox"/> | <input checked="" type="checkbox"/> | No gully erosion was identified in the production area or associated water conveyances.   |
| g. Livestock travel lanes                       | <input type="checkbox"/> | <input checked="" type="checkbox"/> | N/A   |
| h. Nutrient discharge                           | <input type="checkbox"/> | <input checked="" type="checkbox"/> | There are no observable nutrient discharges occurring, at the time of the site evaluation, from the production areas.   |
| i. Objectionable odors                          | <input type="checkbox"/> | <input checked="" type="checkbox"/> | No unusual or excessive odors were observed during the site visit.  |
| j. Particulate matter emissions                 | <input type="checkbox"/> | <input checked="" type="checkbox"/> | Through ventilation fans, typical levels. Grass filters in place to harbor and treat emissions.   |
| k. Ponding, flooding, seasonal high water table | <input type="checkbox"/> | <input checked="" type="checkbox"/> | No issues were identified during the site visit.  |
| l. Sediment                                     | <input type="checkbox"/> | <input checked="" type="checkbox"/> | No obvious and observable sediment discharges are occurring from the production areas.  |
| m. Streambank/shoreline erosion                 | <input type="checkbox"/> | <input checked="" type="checkbox"/> | None present.   |
| n. Threatened/endangered species                | <input type="checkbox"/> | <input checked="" type="checkbox"/> | No geospatial indicators have been identified on the production area.   |
| o. Waste storage                                | <input type="checkbox"/> | <input checked="" type="checkbox"/> | There are no resource concerns identified with the waste storage. Roofed manure shed for poultry and circular tank storage for egg wash are both being managed appropriately.           |
| p. Waterways                                    | <input type="checkbox"/> | <input checked="" type="checkbox"/> | In good vigorous sod. All water conveyances are being managed appropriately.  |
| q. Wetlands                                     | <input type="checkbox"/> | <input checked="" type="checkbox"/> | Production area and manageable prior converted cropland are either 100 feet from wetlands or skirted with vegetation and the required setbacks are in place to protect these resources. |

| <b>Name:</b>            | Cal-Maine Foods, Inc.                        | <b>Agency Interest #:</b>     | 22189 (Orig. Ref.#: 134865)         |   |
|-------------------------|--|-------------------------------|-------------------------------------|---|
| <b>Planner:</b>         | David D. Kann                                | <b>Farm # / Tract #:</b>      | Warwick Pullet                      |   |
| <b>Site Visit Date:</b> | 08/23/2024                                   | <b>Total Acres:</b>           | 6.5                                 |   |
| <b>County:</b>          | Cecil  | <b>Production Area Acres:</b> | 6.5 acres                           |   |
| RESOURCE CONCERN        |  | YES                           | NO                                  | ASSESSMENT  |
| a.                      | Biosecurity measures                         | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | All precautionary measures are in place and being followed. Visitor restrictions.   |
| b.                      | Chemical handling                            | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | All chemicals are stored in an appropriate designated storage area.   |
| c.                      | Cultural resources                           | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | The production area is established and there are no proposed ground disturbance activities scheduled for the area.  |
| d.                      | Feedlot area                                 | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | N/A   |
| e.                      | Floodplains                                  | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | This is an existing operation and the production area is not located in the FEMA-100 year floodplain as per online mapping resources.   |
| f.                      | Gully erosion                                | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | No gully erosion was identified in the production area or associated water conveyances.   |
| g.                      | Livestock travel lanes                       | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | N/A   |
| h.                      | Nutrient discharge                           | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | There are no observable nutrient discharges occurring, at the time of the site evaluation, from the production areas.   |
| i.                      | Objectionable odors                          | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | No unusual or excessive odors were observed during the site visit.  |
| j.                      | Particulate matter emissions                 | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | Through ventilation fans, typical levels. Grass filters in place to harbor and treat emissions.   |
| k.                      | Ponding, flooding, seasonal high water table | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | No issues were identified during the site visit.  |
| l.                      | Sediment                                     | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | No obvious and observable sediment discharges are occurring from the production areas.  |
| m.                      | Streambank/shoreline erosion                 | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | None present.   |
| n.                      | Threatened/endangered species                | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | No geospatial indicators have been identified on the production area.   |
| o.                      | Waste storage                                | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | There are no resource concerns identified with the waste storage. Roofed manure shed (center building) for poultry manure.  |
| p.                      | Waterways                                    | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | In good vigorous sod. All water conveyances are being managed appropriately.  |
| q.                      | Wetlands                                     | <input type="checkbox"/>      | <input checked="" type="checkbox"/> | Production area and manageable prior converted cropland are either 100 feet from wetlands or skirted with vegetation and the required setbacks are in place to protect these resources. |
