

Technical Memorandum

Point Sources of Sediment in the Non-Tidal Port Tobacco River Watershed

The U.S. Environmental Protection Agency (USEPA) requires that Total Maximum Daily Load (TMDL) allocations account for all sources of each impairing pollutant (CFR 2012). This technical memorandum identifies the point sources of sediment in the Port Tobacco River watershed (MD 8-Digit 02140109). Detailed allocations are provided for those point sources included within the Port Tobacco River Wastewater Wasteload Allocation (WLA) and National Pollutant Discharge Elimination System (NPDES) Stormwater WLA. The State reserves the right to allocate the TMDLs among different sources in any manner that is reasonably calculated to protect aquatic life from sediment related impacts.

The Port Tobacco River Watershed sediment TMDL is presented in terms of an average annual load established to ensure the support of aquatic life. In the Port Tobacco River watershed, WLAs have been calculated for individual wastewater treatment facilities, individual and general municipal separate storm sewer systems (MS4) permits, the general permit for stormwater discharges from industrial activities, and the general permit for stormwater discharges from construction sites. The permits can be grouped into two categories, wastewater and stormwater.

The wastewater category includes those loads generated by continuous discharge sources whose permits have total suspended solids (TSS) limits (i.e., contributors to the watershed sediment load). Wastewater permits that do not meet these conditions are considered *de minimis* in terms of the total watershed sediment load. There are three wastewater permits with explicit TSS limits in the non-tidal Port Tobacco River watershed that contribute to the watershed sediment load.

The stormwater category includes all NPDES regulated stormwater discharges, both general and individual. In the Port Tobacco River watershed, these include the Charles County Phase I jurisdictional MS4 permit, the Phase I State Highway Administration (SHA) MS4 permit, and other general NPDES stormwater permits. These stormwater permits are regulated based on Best Management Practices (BMPs) and do not include TSS limits. In the absence of TSS limits, the baseline loads for these NPDES regulated stormwater discharges are calculated based on the loads from the urban land use within the watershed. The associated WLAs are calculated by applying reductions to the urban land use loads. These calculations are described in more detail below.

Individual WLAs have been calculated for the Charles County Phase I jurisdictional MS4 permit, the general municipal Phase II MS4 permit, which includes La Plata, and the SHA Phase I MS4 permit. Aggregate WLAs have been calculated for other general NPDES stormwater permits. Other NPDES regulated stormwater permits include all industrial facilities permitted for stormwater discharges and general construction permits. This aggregate WLA is referred to as the "Other NPDES regulated stormwater" WLA.

FINAL

In order to use a reference watershed approach for this TMDL, sediment loads are estimated using a watershed model. The watershed model chosen for the non-tidal Port Tobacco River Sediment TMDL was the Chesapeake Bay Program Phase 5.3.2 (CBP P5.3.2) watershed model 2009 Progress Scenario *edge-of-stream* (EOS) sediment loads. Within this TMDL, the NPDES regulated stormwater baseline sediment loads are represented by the urban land-use EOS loads associated with the NPDES stormwater permits within the watershed. Urban land-use EOS loads are calculated within the CBP P5.3.2 watershed model as a product of the land use area, land use target *edge-of-field* (EOF) loading rate, and loss from the EOF to the main channel (i.e., sediment delivery factor). BMP data and reduction efficiencies are then subsequently applied to calculate the final EOS loads (USEPA 2010). Further details regarding general nonpoint source sediment load calculations can be found in Section 2.2.1 of the main report.

In order to calculate the NPDES stormwater WLA, MDE further refined the CBP P5.3.2 urban land-use. For any given watershed, the refined CBP P5.3.2 land-use contains the specific level of detail needed to determine individual and aggregate WLAs for Phase I jurisdictional MS4s, the SHA Phase I MS4, and Phase II jurisdictional MS4s, and an aggregate WLA for “Other NPDES Regulated Stormwater” entities. The methods used by MDE to refine the CBP P5.3.2 urban land-use are described within MDE’s documentation, *CBP P5.3.2 Land-Use and MDE Urban Source Sector Delineation - Development Methodology* (MDE 2011).

In order to achieve the estimated sediment load reductions applied to urban land, which are necessary to meet the Port Tobacco River sediment TMDL, current Phase I and Phase II MS4 permits require the jurisdictions to retrofit 20% of existing impervious area where there is failing, minimal, or no stormwater management (estimated to be areas developed prior to 1985). That is, the jurisdiction needs to install/institute stormwater management practices to treat runoff from these existing impervious areas (MDE 2009). Extending these permitting requirements to all urban stormwater sources (*i.e.*, not solely those sources regulated via Phase I MS4 permits) would require that all impervious areas developed prior to 1985 be retrofit at this pace. Additionally, MDE estimates that future stormwater retrofits will have, on average, a 65% TSS reduction efficiency (Claytor and Schueler 1997; Baldwin, Weammert, and Simpson 2007; Baish and Caliri 2009). By default, these retrofits will also provide treatment of any adjacent urban pervious runoff within the applicable drainage area (See Sections 4.5 and 4.6 of the main report for further details).

Table 1 identifies all of the applicable NPDES stormwater permits in the Port Tobacco River watershed. Table 3 provides the distribution of the NPDES Regulated Stormwater WLA in the Port Tobacco River watershed amongst the permits identified in Table 2.

Table 1: Port Tobacco River Sediment TMDL Wastewater Point Source WLAs

Facility Name	NPDES #	Permit Type	Baseline Load (ton/yr)	WLA (ton/yr)	Reduction (%)	MDL ton/day
Bel Alton WWTP	MD0050334	Municipal (Surface)	1.5	1.5	0	0.01
College Of Southern Maryland	MD0052311	Municipal (Surface)	2.7	2.7	0	0.01
Mount Carmel Woods WWTP	MD0053228	Municipal (Surface)	0.1	0.1	0	0

Table 2: Port Tobacco River Watershed NPDES Stormwater Permits

NPDES Permit #	Facility Name	NPDES Regulated Stormwater WLA Sector
MD0068365	Charles County	County Phase I MS4
MD0068276	State Highway Administration	SHA Phase I MS4
MDR055500	La Plata	Municipality Phase II MS4
MDR002076	Pepsi Bottling Group	General Permit- Other NPDES Regulated Stormwater
MDR001671	Reliable Contracting Company - White Plains	General Permit- Other NPDES Regulated Stormwater
MDR001959	SHA - La Plata Maintenance Facility	General Permit- Other NPDES Regulated Stormwater
MDR001220	Waste Management Of Maryland - Southern Maryland	General Permit- Other NPDES Regulated Stormwater
MDRC ¹	MDE General Permit to Construct	Other NPDES Regulated Stormwater

Note: ¹N/A: Permit does not have a NPDES number.

Table 3: Port Tobacco River Sediment TMDL Allocations for NPDES Regulated Stormwater WLAs

NPDES Regulated Stormwater Sector	NPDES #	Baseline Load (ton/yr)	WLA (ton/year)	Reduction (%)	MDL (ton/day)
Charles County Phase I MS4	MD0068365	265	175	34	0.75
La Plata Phase II MS4	MDR055500	57	38	33	0.16
SHA Phase I MS4	MD0068276	30	20	33	0.08
“Other NPDES Regulated Stormwater”	N/A	236	233	1	1
Total		588	466	21	2

Note: Individual values may not add to totals due to rounding
