1.0 INTRODUCTION

ARM Group LLC (ARM), on behalf of EnviroAnalytics Group (EAG), has completed a Phase II Investigation of a portion of the Tradepoint Atlantic property (formerly Sparrows Point Terminal, LLC) that has been designated as Area B: Parcel B21 (the Site). Parcel B21 is comprised of 60.5 acres of the approximately 3,100-acre former steel making facility (**Figure 1**). The Site is bounded to the southwest by a locomotive shop (within Parcel B23), to the northwest by the Tin Mill Canal (TMC), to the east by the former Continuous Sheet Mills inside the greater Finishing Mills Area (within Parcel B22), and to the south by a slab storage area and parking lot (within Parcel B2).

The Phase II Investigation was performed in accordance with procedures outlined in the approved Phase II Investigation Work Plan – Area B: Parcel B21. This Work Plan (Revision 1 dated June 28, 2018) was approved by the Maryland Department of the Environment (MDE) and the United States Environmental Protection Agency (USEPA) on July 11, 2018. This Work Plan was completed in compliance with requirements pursuant to the following:

- Administrative Consent Order (ACO) between Tradepoint Atlantic (formerly Sparrows Point Terminal, LLC) and the MDE effective September 12, 2014; and
- Settlement Agreement and Covenant Not to Sue (SA) between Tradepoint Atlantic (formerly Sparrows Point Terminal, LLC) and the USEPA effective November 25, 2014.

An application to enter the full Tradepoint Atlantic property (3,100 acres) into the Maryland Department of the Environment Voluntary Cleanup Program (MDE-VCP) was submitted to the MDE and delivered on June 27, 2014. The property's current and anticipated future use is Tier 3 (Industrial), and plans for the property include demolition and redevelopment over the next several years. Parcel B21 is also part of the acreage that remains subject to the requirements of the Multimedia Consent Decree between Bethlehem Steel Corporation, the USEPA, and the MDE (effective October 8, 1997) as documented in correspondence received from the USEPA on September 12, 2014.

1.1. SITE HISTORY

From the late 1800s until 2012, the production and manufacturing of steel was conducted at Sparrows Point. Iron and steel production operations and processes at Sparrows Point included raw material handling, coke production, sinter production, iron production, steel production, and semi-finished and finished product preparation. In 1970, Sparrows Point was the largest steel facility in the United States, producing hot and cold rolled sheets, coated materials, pipes, plates, and rod and wire. The steel making operations at Sparrows Point ceased in fall 2012.

Parcel B21 was formerly occupied by a portion of the Finishing Mills Area (consisting primarily of the Continuous Tin Mill) containing numerous steel making facilities. Several iron and steel work processes were completed within the boundary of Parcel B21. The No. 3 Pickler included five pickling tanks used to remove scale from the steel bands. The 48" Tandem Mill reduced the steel strip in thickness, produced a smooth/dense surface, and developed the required metallurgical properties. The No. 6 Washer was used to clean strips from the Tandem Mill with a caustic solution before annealing. The Box Annealing facility annealed coils to varying degrees of hardness determined by the customer's end use. The No. 5 Continuous Anneal combined the caustic cleaning process with continuous annealing. Product from the No. 5 Continuous Anneal and the batch Box Annealing operation was delivered to the No. 6 Skin Pass Mill. The No. 6 Skin Pass Mill reduced the gauge, tempered the steel, and prepared the surface of the strip for finishing. The No. 3 Duo Mill was used to reduce the thickness of the annealed strip and temper the steel. Three Coil Preparation Lines were used in the Tin Mill to prepare the final product for packaging and shipping. The No. 1 Tin Plate Line applied a tin coating to a prepared coil. The No. 2 Tin Plate Line also applied a tin coating to a prepared coil through a very similar process. In the No. 8 Chrome Line, the strip was plated with chrome. Additional information regarding historic iron and steel work processes can be found in the Parcel B21 Phase II Investigation Work Plan (Revision 1 dated June 28, 2018).

1.2. OBJECTIVES

The objective of this Phase II Investigation was to characterize the nature and extent of contamination at the Site. A summary table of the site investigation locations, including the boring identification numbers and the analyses performed, is provided as **Appendix A**. This report includes a summary of the work performed, including the environmental setting, site investigation methods, analytical results and data usability assessment, and findings and recommendations.

As specified in the approved Work Plan for Parcel B21, groundwater at the Site was investigated as described in the separate Area B Groundwater Investigation Work Plan (Revision 3 dated October 6, 2015), and the Finishing Mills Groundwater Investigation Work Plan (Revision 1 dated July 7, 2016). The final versions of these Work Plans were approved by the agencies on October 5, 2015 and June 28, 2016, respectively. The Area B Groundwater Phase II Investigation Report (Revision 0 dated September 30, 2016) and the Finishing Mills Groundwater Phase II Investigation Report (Revision 0 dated November 30, 2016) have been submitted to the agencies and discuss the detailed findings of each groundwater investigation.

2.0 ENVIRONMENTAL SETTING

2.1. LAND USE AND SURFACE FEATURES

The Tradepoint Atlantic property consists of the former Sparrows Point steel mill. According to the Phase I Environmental Site Assessment (ESA) prepared by Weaver Boos dated May 19, 2014, the property is zoned Manufacturing Heavy-Industrial Major (MH-IM). Surrounding property zoning classifications (beyond Tradepoint Atlantic) include the following: Manufacturing Light (ML); Resource Conservation (RC); Density Residential (DR); Business Roadside (BR); Business Major (BM); Business Local (BL); and Residential Office (RO). Light industrial and commercial properties are located northeast of the property and northwest of the property across Bear Creek. Residential areas of Edgemere and Fort Howard are located northeast of the property across Jones Creek and to the southeast across Old Road Bay, respectively. Residential and commercial areas of Dundalk are located northwest of the property across Bear Creek.

According to topographic maps provided by EAG, the surface elevations within Parcel B21 range between approximately 8 and 12 feet above mean sea level (amsl). The elevations across the Site appear to be relatively uniform in most areas. Beyond the northern parcel boundary and most of the western parcel boundary, the land surface elevations slope sharply downward to the adjacent TMC. According to Figure B-2 of the Stormwater Pollution Prevention Plan (SWPPP) Revision 6 dated February 22, 2018, surface waters that are collected in the TMC and treated at the Humphrey Creek Wastewater Treatment Plant (HCWWTP) ultimately flow through National Pollutant Discharge Elimination System (NPDES) permitted Outfall 014, which discharges off-site to Bear Creek.

2.2. REGIONAL GEOLOGY

The Site is located within the Atlantic Coastal Plain Physiographic Province (Coastal Plain). The western boundary of the Coastal Plain is the “Fall Line”, which separates the Coastal Plain from the Piedmont Plateau Province. The Fall Line runs from northeast to southwest along the western boundary of the Chesapeake Bay, passing through Elkton (MD), Havre de Grace (MD), Baltimore City (MD), and Laurel (MD). The eastern boundary of the Coastal Plain is the off-shore Continental Shelf.

The unconsolidated sediments beneath the Site belong to the Talbot Formation (Pleistocene), which is then underlain by the Cretaceous formations which comprise the Potomac Group (Patapsco Formation, Arundel Formation and the Patuxent Formation). The Potomac Group formations are comprised of unconsolidated sediments of varying thicknesses and types, which may be several hundred feet to several thousand feet thick. These unconsolidated formations may overlie deeper Mesozoic and/or Precambrian bedrock. Depth to bedrock is approximately 700 feet within the Site.

2.3. SITE GEOLOGY

Groundcover at the Site is comprised of approximately 35% natural soils and 65% non-native fill materials (i.e., slag) based on the approximate shoreline of the Sparrows Point Peninsula in 1916, as shown on **Figure 2** (adapted from Figure 2-20 in the Description of Current Conditions (DCC) Report prepared by Rust Environment and Infrastructure dated January 1998).

In general, the encountered subsurface geology included interbedded non-native fill materials (sand, gravel, cobbles, slag, wood, and brick) and natural soils, which included fine-grained sediments (clays and silts) and coarse-grained sediments (sands and gravels). Non-native fill materials were encountered at depths of up to 20 feet below the ground surface (bgs). In addition, drilling refusals were encountered at many of the soil boring locations due to variable thicknesses of concrete. The shallow groundwater table was observed in soil borings at depths ranging from 6 to 16.5 feet bgs across the Site; however, groundwater was not encountered at every boring location. Soil boring observation logs are provided in **Appendix B**. Please note that unless otherwise indicated, all Unified Soil Classification System (USCS) group symbols provided on the attached boring logs are from visual observations, and not from laboratory testing.

3.0 SITE INVESTIGATION

A total of 140 soil samples (from 68 boring locations) were collected for analysis between July 16, 2018 and September 7, 2018 as part of the Parcel B21 Phase II Investigation. This Phase II Investigation utilized methods and protocols that followed the procedures included in the Quality Assurance Project Plan (QAPP) dated April 5, 2016 approved by the agencies to support the investigation and remediation of the Tradepoint Atlantic property. Information regarding the project organization, field activities and sampling methods, sampling equipment, sample handling and management procedures, the selected laboratory and analytical methods, quality control and quality assurance procedures, investigation-derived waste (IDW) management methods, and reporting requirements are described in detail in the approved Parcel B21 Work Plan (Revision 1 dated June 28, 2018), and the QAPP.

All site characterization activities were conducted under the property-wide Health and Safety Plan (HASP) provided as Appendix F of the approved Work Plan.

3.1. SAMPLE TARGET IDENTIFICATION

Previous activities within and around the buildings and facilities located on the Tradepoint Atlantic property may have been historical sources of environmental contamination. If present, source areas were identified as targets for sampling through a careful review of historical documents. When a sampling target was identified, at least two borings were placed at or around its location using GIS software (ArcMap Version 10.4.1).

Sampling targets included, as applicable, 1) Recognized Environmental Conditions (RECs) shown on the REC Location Map provided in Weaver Boos' Phase I ESA, 2) additional findings (non-RECs) from the Phase I ESA which were identified as potential environmental concerns, and 3) Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) identified from the DCC Report prepared by Rust Environment and Infrastructure. The following RECs were identified in the Parcel B21 Work Plan: Halogen Lines Trenches/Sumps (undesignated REC, Finding 43, also listed as SWMU 88) and Tin Mill Trenches/Sumps (REC 1R, Finding 39, also listed as SWMU 84). There were no additional SWMUs identified at the Site based on the DCC Report, besides those already cross-listed as RECs. The following AOCs in Parcel B21 were identified in the DCC Report: Former 1988 PCB Spill Area (AOC B) and Former 1991 Acid Leak Area (AOC I). All of the identified RECs and AOCs are described in further detail within the Parcel B21 Work Plan.

Four sets of historical drawings were also reviewed to identify potential sampling targets for the Site. These drawings included the 5000 Set (Plant Arrangement), the 5100 Set (Plant Index), the 5500 Set (Plant Sewer Lines), and a set of drawings indicating coke oven gas distribution drip leg locations. Drip legs are points throughout the distribution system where coke oven gas

condensate was removed from the gas pipelines. The condensate from the drip legs was typically discharged to drums, although it is possible some spilled out of the drums and on to the ground. Only drip legs which were located greater than 100 feet from the nearest Phase II Investigation proposed soil boring were included as sampling targets. A summary of the specific drawings covering the Site is presented in **Table 1**. Sampling target locations were identified if the historical drawings depicted industrial activities or a specific feature at a location that may have been a source of environmental contamination that potentially impacted the Site.

Based on the review of plant drawings, additional non-REC sampling targets were identified at the Site that included the following: Fuel Shop, Hydraulic Repair Shops, Oil House, Oil Heater, Palm Oil Cooker Aisle, Possible PCB-Contaminated Areas, Chromium Pits, Electric Sub-Stations and Transformers, and numerous Tanks (acid, oil/petrosan/hydraulic, and plating). A summary of the areas that were investigated, along with the applicable boring identification numbers and the analyses performed, has been provided as **Appendix A**. Additional sample locations were distributed to fill in large spatial gaps between proposed borings to provide complete coverage of the Site. During the completion of fieldwork, it was necessary to shift some borings from the approved locations given in the Work Plan, primarily due to access restrictions and/or refusal. **Table 2** provides the identification numbers of the adjusted borings, the coordinates of the proposed and final locations, and the distance/direction of the field shifts.

The density of soil borings met the requirements set forth in QAPP Worksheet 17 – Sampling Design and Rationale. As defined in the Work Plan, Parcel B21 contained a total of 9.4 acres without engineered barriers and 51.1 acres with engineered barriers. In accordance with the relevant sampling density requirements, a minimum of 10 soil boring locations were required to cover the area without engineered barriers, and a minimum of 13 soil boring locations were required to cover areas with engineered barriers. A total of 23 borings were required to meet the density specification; however, 73 borings were advanced during this Phase II Investigation, with analytical samples successfully collected from 68 locations. The number of completed borings and any deviations from the original sampling plan are further described in Section 3.2.

3.2. SOIL INVESTIGATION

Continuous core soil borings were advanced at 73 locations across the Site to assess the presence or absence of soil contamination, and to assess the vertical distribution of any encountered contamination (**Figure 3**). Analytical soil samples were successfully collected from 68 of the completed locations. The continuous core soil borings were advanced to a maximum depth of 20 feet bgs using the Geoprobe® MC-7 Macrocore soil sampler (surface to 10 feet bgs), and the Geoprobe® D-22 Dual-Tube Sampler (depths >10 feet bgs). At each of the completed boring locations, each soil core was visually inspected and screened with a hand-held photoionization detector (PID) prior to logging soil types. Soil boring logs have been included as **Appendix B**, and the PID calibration log has been included as **Appendix C**. Unless otherwise indicated, all USCS group symbols provided on the attached boring logs are from visual observations.

Due to the presence of thick concrete slabs across much of the Site, numerous boring locations encountered equipment refusal while using the Geoprobe® direct push unit. A concrete-coring subcontractor was engaged to core through the slabs to facilitate the collection of analytical samples at the locations where refusal was encountered at the surface. B21-037-SB was not able to be cored by the subcontractor due to the presence of soil overlying thick concrete, and this location was not completed. In addition, analytical samples were not able to be collected from five locations that were cored by the subcontractor (B21-041-SB, B21-042-SB, B21-056-SB, B21-061-SB, and B21-062-SB) due to equipment refusal and/or lack of recovery below the cored hole. The specific conditions which prevented sample collection can be viewed on the boring logs in **Appendix B**.

In each boring, one shallow sample was collected from the 0 to 1 foot depth interval. If a concrete slab or surface cover materials (such as paving or gravel) were present, the first 1 foot of soil beneath this layer was collected as the shallow sample. In many cases, the “shallow” soil samples were collected from depths that were deeper than is typical for other similar investigations on the property due to the thicknesses of the concrete slabs present in the former Continuous Tin Mill. In many cases, the shallow samples that are usually collected from the 0 to 1 foot depth interval were collected from depths of 2 or 3 feet bgs, or in a few select cases as deep as 4 feet bgs. The adjusted shallow samples were analyzed in accordance with the usual requirements for shallow soil samples.

An underlying sample was collected from the 4 to 5 foot depth interval from each continuous core soil boring, but could be adjusted based on field observations. If the PID or other field observations indicated contamination to exist at a depth greater than 3 feet bgs but less than 9 feet bgs, and above the water table, the sample from the deeper 4 to 5 foot interval was shifted to the alternate depth interval. One additional set of samples was also collected from the 9 to 10 foot depth interval if groundwater had not been encountered. It should be noted that soil samples were not collected from a depth that was below the water table. The 10-foot bgs samples may have been held by the laboratory prior to analysis in accordance with the requirements given in the Parcel B21 Work Plan. These project-specific requirements for the analysis of 10-foot bgs samples are further described below.

Soil sampling activities were conducted in accordance with the procedures and methods referenced in **Field Standard Operating Procedure (SOP) Numbers 008, 009, 012, and 013** provided in Appendix A of the QAPP. Down-hole soil sampling equipment was decontaminated after soil sampling had been concluded at a location, according to the procedures and methods referenced in **Field SOP Number 016** provided in Appendix A of the QAPP.

Each soil sample collected during this investigation was submitted to Pace Analytical Services, Inc. (PACE) for analysis. As stated above, the 10-foot bgs samples may have been held prior to analysis in accordance with the Parcel B21 Work Plan. Excluding these deep samples, the

remaining soil samples were analyzed for Target Compound List (TCL) semi-volatile organic compounds (SVOCs) via USEPA Methods 8270 and 8270 SIM, Oil & Grease via USEPA Method 9071, total petroleum hydrocarbon (TPH) diesel range organics (DRO) and gasoline range organics (GRO) via USEPA Method 8015, Target Analyte List (TAL) Metals via USEPA Methods 6010 and 7471, hexavalent chromium via USEPA Method 7196, and cyanide via USEPA Method 9012. Samples from any depth interval with a sustained PID reading of greater than 10 ppm were also analyzed for TCL volatile organic compounds (VOCs) via USEPA Method 8260. Additionally, the shallow soil samples collected across the Site from the 0 to 1 foot bgs interval were analyzed for polychlorinated biphenyls (PCBs) via USEPA Method 8082. As noted above, several of the shallow samples were collected from depths that were deeper than is typical due to the presence of thick concrete slabs. Select locations in the vicinity of the historical PCB spill designated as AOC B were analyzed for PCBs at additional sample depths. Sample containers, preservatives, and holding times for the sample analyses are listed in the QAPP Worksheet 19 & 30 – Sample Containers, Preservation, and Holding Times.

If the PID reading from the 9 to 10 foot bgs interval was less than 10 ppm, all parameters were held by the laboratory pending the analysis of the 0 to 1 and 4 to 5 foot bgs (or field adjusted interval) samples. If the 9 to 10 foot bgs interval exhibited a sustained PID reading of 10 ppm, this sample was released to be analyzed for VOCs, SVOCs, TPH-DRO, TPH-GRO, and Oil & Grease. However, the samples for metals and cyanide were held by the laboratory pending the analysis of the 0 to 1 and 4 to 5 foot bgs interval samples. If the preliminary laboratory results from the 4 to 5 foot bgs interval indicated exceedances of the Project Action Limits (PALs) for any constituents, the held sample from the 9 to 10 foot bgs interval was then released to be analyzed for those constituents that exhibited PAL exceedances in the overlying sample.

3.3. MANAGEMENT OF INVESTIGATION-DERIVED WASTE (IDW)

In accordance with **Field SOP Number 005** provided in Appendix A of the QAPP, potentially impacted materials, or IDW, generated during this Phase II Investigation was containerized in 55-gallon (DOT-UN1A2) drums. The types of IDW that were generated during this Phase II Investigation included the following:

- soil cuttings generated from soil borings;
- decontamination fluids; and
- used personal protective equipment

Following the completion of field activities, composite samples were gathered with aliquots from each of the Parcel B21 Phase II IDW soil drums for waste characterization. Following the analysis of each sample, the waste soil was characterized as non-hazardous. A list of all results from the soil waste characterization procedure can be found in **Table 3**. IDW drums containing aqueous materials were characterized by preparing composite samples from randomly selected

drums. Each composite sample included aliquots from several individual drums that were chosen as a subset of the aqueous drums being staged on-site at the date of collection. Following the analysis of each sample, the aqueous waste was characterized as non-hazardous. A list of all results from the aqueous waste characterization procedure can be found in **Table 4**.

The parcel-specific IDW drum log from the Phase II investigation is included as **Appendix D**. All IDW procedures were carried out in accordance with methods referenced in the QAPP Worksheet 21 – Field SOPs and Appendix A of the QAPP.

4.0 ANALYTICAL RESULTS

4.1. SOIL CONDITIONS

Soil analytical results were screened against PALs established in the property-wide QAPP (or other direct guidance from the agencies; i.e. TPH/Oil & Grease) to determine PAL exceedances. PALs are generally based on the USEPA's Regional Screening Levels (RSLs) for the Composite Worker exposure to soil. The Composite Worker is defined by the USEPA as a long-term receptor exposed during the workday who is a full-time employee that spends most of the workday conducting maintenance activities (which typically involve on-site exposures to surface soils) outdoors.

The analytical results for the detected parameters are summarized and compared to the PALs in **Table 5** (Organics) and **Table 6** (Inorganics). The laboratory Certificates of Analysis (including Chains of Custody) and Data Validation Reports (DVRs) have been included as electronic attachments. The DVRs contain a glossary of qualifiers for the final flags assigned to individual results in the attached summary tables.

4.1.1. Soil Conditions: Organic Compounds

As provided in **Table 5**, several VOCs were identified above the laboratory's method detection limits (MDLs) in the soil samples collected from across the Site. There were no VOCs detected above their respective PALs.

Table 5 provides a summary of SVOCs detected above the laboratory's MDLs in the soil samples collected from across the Site. The PALs for relevant polynuclear aromatic hydrocarbons (PAHs) have been adjusted upward based on revised toxicity data published in the USEPA RSL Composite Worker Soil Table. Therefore, exceedances for PAHs are based on the adjusted PALs rather than those presented in the QAPP. Five SVOCs (benz[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, dibenz[a,h]anthracene, and hexachlorobenzene) were detected above their PAL. Benzo[a]pyrene was the most common exceedance and was detected above the PAL in 20 soil samples with a maximum detection of 32.8 mg/kg in sample B21-003-SB-5. The SVOC PAL exceedance locations and results are provided on **Figure S1**.

Shallow soil samples collected across the Site from the 0 to 1 foot bgs (or adjusted) interval were analyzed for PCBs. Numerous shallow soil sample intervals required shifting to greater sampling depths due to surficial concrete. As previously stated, select locations in the vicinity of the historical PCB spill designated as AOC B were analyzed for PCBs at additional sample depths. **Table 5** provides a summary of PCBs detected above the laboratory's MDLs. Two PCB mixtures (Aroclor 1248 and Aroclor 1260) and total PCBs were detected above the specified PALs. The maximum PCB detection was 15.9 mg/kg of Aroclor 1260 (and total PCBs) in B21-039-SB-2. The PCB PAL exceedance locations and results are provided on **Figure S2**.

Table 5 provides a summary of the TPH/Oil & Grease detections above the laboratory's MDLs in the soil samples collected in the parcel. Exceedances of the Oil & Grease PAL (6,200 mg/kg) were noted in two shallow samples: B21-012-SB-1 with a detection of 19,200 mg/kg and B21-060-SB-1 with a detection of 12,400 mg/kg. Both of these locations had underlying soil samples (above the observed water table) which had significantly lower detections of Oil & Grease that did not exceed the PAL. The 5-foot sample at B21-012-SB had an Oil & Grease detection of 215 mg/kg, and the 4-foot sample at B21-060-SB had an Oil & Grease detection of 470 mg/kg, both of which are significantly below the PAL. There were no PAL exceedances of TPH-DRO or TPH-GRO in any of the soil samples collected at the Site. No physical evidence of non-aqueous phase liquid (NAPL) was noted in the soil cores collected from B21-012-SB or B21-060-SB, or any other soil borings completed under this investigation. Given the lack of physical evidence of NAPL in B21-012-SB and B21-060-SB, and the lack of significant Oil & Grease impacts at greater soil depths, further delineation was not warranted. The Oil & Grease PAL exceedance locations and results are provided on **Figure S3**.

4.1.2. Soil Conditions: Inorganic Constituents

Table 6 provides a summary of inorganic constituents detected above the laboratory's MDLs in the soil samples collected from across the Site. Six inorganic compounds (arsenic, hexavalent chromium, lead, manganese, thallium, and vanadium) were detected above their respective PALs. Arsenic was by far the most common inorganic exceedance. It was detected above its PAL of 3 mg/kg in 104 soil samples collected from the Site, with a maximum detection of 40.1 mg/kg at B21-045-SB-3.5. The remaining inorganic exceedances in soil were less common by comparison. Hexavalent chromium was detected above its PAL in two samples with a maximum detection of 14.9 mg/kg in B21-036-SB-5. Lead was detected above its PAL in three samples with a maximum detection of 1,610 mg/kg in B21-048-SB-1. Manganese was detected above its PAL in 20 samples with a maximum detection of 74,300 mg/kg in B21-072-SB-1. Thallium was detected above its PAL in 22 samples with a maximum detection of 178 mg/kg in B21-014-SB-8. Vanadium was detected above its PAL in two samples with a maximum detection of 13,400 mg/kg in B21-013-SB-5. The inorganic PAL exceedance locations and results are provided on **Figure S4**.

4.1.3. Soil Conditions: Results Summary

Table 5 and **Table 6** provide summaries of the detected organic and inorganic compounds in the soil samples submitted for laboratory analysis, and **Figure S1** through **Figure S4** present the soil boring locations and sample results that exceeded the PALs. **Table 7** provides a summary of results for all PAL exceedances in soil, including maximum values and detection frequencies. **Table 8** indicates which soil impacts (PAL exceedances) are associated with the specific targets listed in the Parcel B21 Work Plan. Exceedances of the PALs among the Parcel B21 soil samples consisted of five SVOCs (benz[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene,

dibenz[a,h]anthracene, and hexachlorobenzene), two PCB mixtures (Aroclor 1248 and Aroclor 1260) and total PCBs, Oil & Grease, and six inorganics (arsenic, hexavalent chromium, lead, manganese, thallium, and vanadium). There were no detections of VOCs or TPH-DRO/GRO above the applicable PALs. No physical evidence of NAPL was observed in the soil cores from any soil borings completed under this investigation.

Lead, PCBs, and TPH/Oil & Grease are subject to special requirements as designated by the agencies: lead results above 10,000 mg/kg are subject to additional delineation (and possible excavation), PCB results above 50 mg/kg are subject to delineation and excavation, and TPH/Oil & Grease results above 6,200 mg/kg should be evaluated for the potential presence and mobility of NAPL in any future development planning:

- There were no locations where detections of lead exceeded 10,000 mg/kg, the designated threshold at which delineation would be required.
- There were no locations where detections of PCBs exceeded 50 mg/kg, the designated threshold at which delineation and excavation would be required.
- There were no PAL exceedances of TPH-DRO/GRO in any of the soil samples collected at the Site. There were two shallow soil samples where detections of Oil & Grease exceeded the PAL of 6,200 mg/kg: B21-012-SB-1 and B21-060-SB-1. Both identified boring locations should be considered for proximity to proposed utilities in any future development plans. Physical evidence of petroleum (i.e., NAPL or sheen) was not observed in any boring at the Site.

4.2. GROUNDWATER CONDITIONS – AREA B AND FINISHING MILLS INVESTIGATIONS

As specified in the approved Parcel B21 Work Plan, groundwater at the Site was investigated as described in the separate Area B Groundwater Investigation Work Plan (dated October 6, 2015) and the separate Finishing Mills Groundwater Investigation Work Plan (dated July 7, 2016). A separate Area B Groundwater Phase II Investigation Report (Revision 0 dated September 30, 2016) and Finishing Mills Groundwater Phase II Investigation Report (Revision 0 dated November 30, 2016) have been submitted to discuss the detailed findings of these groundwater investigations. Groundwater results obtained during these investigations were screened against the PALs established in the QAPP (or other direct guidance from the agencies) to determine exceedances. The complete findings of the groundwater investigations, including detection summary tables and exceedance figures, were provided in the respective Phase II Investigation Reports. A figure summarizing the shallow aqueous PAL exceedances (for all classes of compounds) within or proximate to Parcel B21 is provided as **Appendix E**. The groundwater results obtained from the intermediate and lower hydrogeologic zones are not relevant for this Parcel B21 investigation but can be reviewed in the separate groundwater reports.

Regarding shallow groundwater exceedances, some of the PALs have been updated since the submission of the Area B Groundwater Phase II Investigation Report and the Finishing Mills Groundwater Phase II Investigation Report. In particular, the aqueous screening levels for some PAH constituents have been adjusted upward. Similar to the evaluation of soil data, the PALs for relevant PAHs have been modified based on revised toxicity data published in the USEPA RSL Resident Tapwater Table. Aqueous PAL exceedances in the shallow groundwater within or proximate to Parcel B21 consisted of four VOCs (1,1-dichloroethane, 1,1-dichloroethene, 1,2-dichloroethane, and chloroform), three SVOCs (1,4-dioxane, benz[a]anthracene, and naphthalene), five total/dissolved metals (cobalt, iron, manganese, thallium, and vanadium), cyanide, and DRO. For simplicity, the inorganic PAL exceedances shown on the figure do not include duplicate exceedances of total and dissolved metals at relevant sample locations. If both total and dissolved concentrations exceeded the PAL for a specific compound, the value for total metals is displayed on the figure for each sample.

Each permanent well or temporary groundwater sample collection point sampled during the Area B Groundwater Investigation or the Finishing Mills Groundwater Investigation was checked for the potential presence of NAPL using an oil-water interface probe prior to sampling. During these checks, NAPL was not detected in any of the groundwater sample points completed under either investigation.

Groundwater data were also screened to determine whether any individual sample results, or cumulative results summed by sample location, may exceed the USEPA Vapor Intrusion (VI) Screening Levels (Target Cancer Risk (TCR) of 1E-5 or Target Hazard Quotient (THQ) of 1) as determined by the Vapor Intrusion Screening Level (VISL) Calculator version 3.5 (<https://www.epa.gov/vaporintrusion/vapor-intrusion-screening-levels-visls>). The aqueous PALs specified in the QAPP are based upon drinking water use, which is not a potential exposure pathway for groundwater at the Site. Total cyanide had previously been identified as a potential VI hazard in the Finishing Mills Groundwater Phase II Investigation Report at several locations within and proximate to Parcel B21, but the screening level for cyanide has since been adjusted upward by the USEPA, eliminating this concern at all but one location near the western boundary of the Site (SW-081-MWS). Supplemental sampling has since been conducted at the identified location (outside of the scope of the Finishing Mills Groundwater Investigation) to determine the speciation of cyanide, and the results have indicated that available cyanide is not present at concentrations that could pose a potential VI concern.

5.0 DATA USABILITY ASSESSMENT

The approved property-wide QAPP specified a process for evaluating data usability in the context of meeting project goals. Specifically, the goal of the Phase II Investigation is to determine if potentially hazardous substances or petroleum products (VOCs, SVOCs, PCBs, metals, cyanide, Oil & Grease, or TPH-DRO/GRO) are present in site media (soil) at concentrations that could pose an unacceptable risk to Site receptors. Individual results are compared to the PALs established in the QAPP (i.e., the most current USEPA RSLs) or based on other direct guidance from the agencies, to identify the presence of exceedances in each environmental medium.

Quality assurance and quality control (QA/QC) samples were collected during field studies to evaluate field/laboratory variability. A summary of QA/QC samples associated with this investigation has been included as **Appendix F**. The following QA/QC samples were submitted for analysis to support the data validation:

- Trip Blank – at a rate of one per cooler with VOC samples
 - Soil – VOCs only
- Blind Field Duplicate – at a rate of one per twenty samples
 - Soil – VOCs, SVOCs, Metals, TPH-DRO, TPH-GRO, Oil & Grease, PCBs, hexavalent chromium, and cyanide
- Matrix Spike/Matrix Spike Duplicate – at a rate of one per twenty samples
 - Soil – VOCs, SVOCs, Metals, TPH-DRO, TPH-GRO, Oil & Grease, PCBs, and hexavalent chromium
- Field Blank and Equipment Blank – at a rate of one per twenty samples
 - Soil – VOCs, SVOCs, Metals, TPH-DRO, TPH-GRO, Oil & Grease, hexavalent chromium, and cyanide

The QA/QC samples were collected and analyzed in accordance with the QAPP Worksheet 12 – Measurement Performance Criteria, QAPP Worksheet 20 – Field Quality Control, and QAPP Worksheet 28 – Analytical Quality Control and Corrective Action.

5.1. DATA VERIFICATION

A verification review was performed on documentation generated during sample collection and analysis. The verification included a review of field log books, field data sheets, and Chain of Custody forms to ensure that all planned samples were collected, and to ensure consistency with the field methods and decontamination procedures specified in the QAPP Worksheet 21 – Field SOPs and Appendix A of the QAPP. In addition, calibration logs were reviewed to ensure that field equipment was calibrated and/or checked once per day. The logs have been provided in **Appendix C** (PID calibration log).

The laboratory deliverables were reviewed to ensure that all records specified in the QAPP as well as necessary signatures and dates are present. Sample receipt records were reviewed to ensure that the sample condition upon receipt was noted, and any missing/broken sample containers (if any) were noted and reported according to plan. The data packages were compared to the Chains of Custody to verify that results were provided for all collected samples. The data package case narratives were reviewed to ensure that all exceptions (if any) are described.

5.2. DATA VALIDATION

USEPA Stage 2B data validation was completed for a representative 30% of the environmental sample analyses performed by PACE and supporting Level IV Data Package information by Environmental Data Quality Inc. (EDQI). The DVRs provided by EDQI have been included as electronic attachments.

Sample analyses have undergone an analytical quality assurance review to ensure adherence to the required protocols. The Stage 2B review was performed as outlined in “Guide for Labeling Externally Validated Laboratory Analytical Data for Superfund Use”, EPA-540-R-08-005. Results have been validated or qualified according to general guidance provided in “USEPA National Functional Guidelines for Inorganic Superfund Data Review (ISM02.1)”, USEPA October 2013. Region III references this guidance for validation requirements. This document specifies procedures for validating data generated for Contract Laboratory Program (CLP) analyses. The approved QAPP and the quality control requirements specified in the methods and associated acceptance criteria were also used to evaluate the non-CLP data.

The PACE-Greensburg (PA) laboratory facility implements quality assurance and reporting requirements through the TNI certification program with the State of Pennsylvania; which is accepted by Maryland. Since late-January 2017, these requirements include the flagging of contaminants with a “B” qualifier when an analyte is detected in an associated laboratory method blank, regardless of the level of the contaminant detected in the sample. A method blank is analyzed at a rate of one blank for each 20 sample analytical batch. The USEPA has previously specified that results flagged with the “B” qualifier do not represent legitimate detections. They have also specified that results flagged with a “JB” qualifier are invalid, and any such results should be revised to display the “B” qualifier only.

Although elevated sample results may be “B” qualified by the laboratory as non-detects due to low-level blank detections, EDQI corrects any erroneous “B” qualifiers during the data validation procedure to avoid under-reporting analytical detections. EDQI removes the “B” qualifiers for relevant samples according to the guidance given in the table below. Therefore, a result originally flagged with a “B” qualifier in the laboratory certificate may be reported as a legitimate detection without this qualifier. Likewise, a result originally flagged with a “JB” qualifier in the laboratory certificate may be reported as a “J” qualifier if the erroneous “B” qualifier can be eliminated, but would be reported as a “B” qualified non-detect result if the original “B” qualifier is legitimate.

Blank Result	Sample Result	Qualifying Action
Result less than RL	Result less than RL	Result is Qualified "B"
	Result greater than RL	Remove "B"
Result greater than RL	Result less than Blank Result	Result is Qualified "B"
	Result greater than Blank Result	Remove "B"

RL = Reporting Limit

As directed by EDQI, ARM has reviewed all non-validated laboratory reports (those which were not designated to be reviewed by EDQI), and applied the same validation corrections to any relevant “B” or “JB” qualified results. This review of the non-validated data ensures that any elevated detections of parameters, including those which may exceed the PALs, are not mistakenly reported as non-detect values simply because they did not undergo the formal validation procedure by EDQI. ARM has also revised the non-validated results to eliminate any laboratory-specific, non-standardized qualifiers (L2, 6c, ip, 4c, etc.), which are customarily removed by EDQI during the validation procedure.

5.3. DATA USABILITY

The data were evaluated with respect to the quality control elements of precision, bias, representativeness, comparability, completeness, and sensitivity relative to data quality indicators and performance measurement criteria outlined in QAPP Worksheet 12 – Measurement Performance Criteria. The following discussion details deviation from the performance measurement criteria, and the impact on data quality and usability.

The measurement performance criteria of precision and bias were evaluated in the data validation process as described in the DVRs provided as electronic attachments. Where appropriate, potential limitations in the results have been indicated through final data flags. These flags indicate whether particular data points were quantitative estimates, biased high/low, associated with blank contamination, etc. Individual data flags are provided with the results in the detection summary tables. A qualifier code glossary is included with each DVR provided by EDQI. Particular results may have been marked with the “R” flag if the result was deemed to be unreliable and was not included in any further evaluation. The soil results that were rejected are given in **Table 9**. Data completeness (the proportion of valid data) is discussed below.

Representativeness is a measure of how accurately and precisely the data describe the Site conditions. Representativeness of the samples submitted for analysis was ensured by adherence to standard sampling techniques and protocols, as well as appropriate sample preservation prior to analysis. Sampling was conducted in accordance with the QAPP Worksheet 21 – Field SOPs and Appendix A of the QAPP. Specific Field SOPs applicable to the assessment of representativeness include **Field SOP Numbers 008, 009, 010, 011, 017, and 024**. Review of the field notes and laboratory sample receipt records indicated that collection of soil at the Site was representative, with no significant deviations from the SOPs.

Comparability describes the degree of confidence in comparing two sets of data. Comparability is maintained across multiple datasets by the use of consistent sampling and analytical methods across multiple project phases. Comparability of sample results was ensured through the use of approved standard sampling and analysis methods outlined in the QAPP. QA/QC protocols help to maintain the comparability of datasets, and in this case were assessed via blind duplicates, blank samples, and spiked samples, where applicable. No significant deviations from the QAPP were noted in the dataset.

Sensitivity is a determination of whether the analytical methods and quantitation limits will satisfy the requirements of the project. The laboratory reports were reviewed to verify that reporting limits met the quantitation limits for specific analytes provided in QAPP Worksheet #15 – Project Action Limits and Laboratory-Specific Detection/Quantitation Limits. In general, the laboratory reporting limits met the detection and quantitation limits specified in the QAPP.

Completeness is expressed as a ratio of the number of valid data points to the total number of analytical data results. Non-usable (“R” flagged) data results were determined through the data validation process. The approved QAPP specifies that the completeness of data is assessed by professional judgement but should be greater than or equal to 90%. Data completeness for each compound is provided in **Appendix G**. This evaluation of completeness includes only the representative 30% of sample results which were randomly selected for validation.

A total of four analytes (1,1,2,2-tetrachloroethane, 1,4-dioxane, benzaldehyde, and hexavalent chromium) did not meet the completeness goal of 90% for soils in Parcel B21. Benzaldehyde had a completeness value of 46% among 57 validated samples. The maximum rejected result of benzaldehyde was 1.9 mg/kg, which is significantly below the PAL of 120,000 mg/kg. The full dataset for 1,4-dioxane which underwent validation was rejected (with only three samples undergoing validation). Among the results reported by the laboratory (including those which did not undergo validation), there was a single detection of 1,4-dioxane at 0.38 mg/kg, which is also well below the PAL of 24 mg/kg. There were no detections of 1,1,2,2-tetrachloroethane (67% completeness with one rejected result out of three validated samples) throughout the Site. Hexavalent chromium had a completeness value of 35% among 57 validated samples. According to the validation report, severe interferences and/or digestion issues caused hexavalent chromium non-detects to be rejected and detections to be marked with a J- flag, indicating a result that is considered biased low. Hexavalent chromium had two detections that exceeded the PAL of 6.3 mg/kg (14.9 mg/kg and 7.1 mg/kg), and the largest rejected (non-detect) hexavalent chromium result was only 1.6 mg/kg.

Overall, the soil data can be used as intended, and significant data gaps were not identified. While a limited set of compounds did not meet the completeness goal of 90%, based on the infrequency and low magnitude of soil detections these do not appear to represent significant data gaps at the Site.

6.0 FINDINGS AND RECOMMENDATIONS

The objective of this Phase II Investigation was to characterize the nature and extent of contamination at the Site. During the Phase II Investigation, a total of 140 soil samples (all locations/depths) were collected and analyzed to define the nature and extent of contamination in Parcel B21. The sampling and analysis plan for the parcel was developed to target specific features that represented a potential release of hazardous substances and/or petroleum products to the environment. Soil samples were analyzed for TCL-VOCs, TCL-SVOCs, Oil & Grease, TPH-DRO/GRO, TAL-Metals, hexavalent chromium, cyanide, and/or PCBs based on the parcel-specific soil sampling plan.

6.1. SOIL

The concentrations of constituents in the soil have been characterized by the Phase II Investigation to provide estimates of exposure point concentrations to support risk assessment.

PCB concentrations are below levels that would warrant delineation and evaluation of a removal remedy (50 mg/kg). Additionally, lead concentrations were below the mandatory delineation threshold (10,000 mg/kg). No further action is required with respect to PCBs or lead at the Site. There were no soil PAL exceedances of VOCs or TPH-DRO/GRO, indicating that these compounds are not significant contaminants in soil at the Site. Exceedances of the soil PALs within Parcel B21 were limited to six inorganics (arsenic, hexavalent chromium, lead, manganese, thallium, and vanadium), five SVOCs (benz[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, dibenz[a,h]anthracene, and hexachlorobenzene), two PCB mixtures (Aroclor 1248 and Aroclor 1260) and total PCBs, and Oil & Grease.

Arsenic was detected in 81% of the analyzed soil samples, with 104 total PAL exceedances and a maximum detection of 40.1 mg/kg in B21-045-SB-3.5. Hexavalent chromium was detected above its PAL in two samples with a maximum detection (14.9 mg/kg) at B21-036-SB-5. Lead was detected above its PAL in three samples with a maximum detection (1,610 mg/kg) at B21-048-SB-1. Manganese was detected above its PAL in 20 samples with a maximum detection (74,300 mg/kg) at B21-072-SB-1. Thallium was detected above its PAL in 22 samples with a maximum detection (178 mg/kg) at B21-014-SB-8. Vanadium was detected above its PAL in two samples with a maximum detection (13,400 mg/kg) at B21-013-SB-5. Benzo[a]pyrene was the most common SVOC exceedance and was detected in 20 soil samples with a maximum detection of 32.8 mg/kg in B21-003-SB-5. The maximum PCB detection was 15.9 mg/kg of Aroclor 1260 (which matched the reported concentration of total PCBs) in B21-039-SB-2.

Elevated concentrations of Oil & Grease were identified above the PAL (6,200 mg/kg) in two shallow samples (B21-012-SB-1 and B21-060-SB-1) with detections of 19,200 mg/kg and 12,400 mg/kg, respectively. However, no physical evidence of NAPL was noted in these soil cores and Oil & Grease detections in the underlying soil samples (above the water table) were

significantly below the PAL. There were no PAL exceedances of TPH-DRO or TPH-GRO in any of the soil samples collected at the Site. No physical evidence of petroleum (i.e., NAPL or sheen) was noted in any soil borings completed under this investigation.

6.2. GROUNDWATER

Groundwater is not used on the Tradepoint Atlantic property (and is not proposed to be utilized); therefore, there is no potential for direct human exposure for a Composite Worker. In the event that future construction/excavation leads to a potential Construction Worker exposure to groundwater, health and safety plans should be implemented to limit exposure risk. Findings from the Area B and Finishing Mills Groundwater Phase II Investigations which include the groundwater data obtained within and proximate to Parcel B21 are presented within the Area B Groundwater Phase II Investigation Report (Revision 0 dated September 30, 2016) and the Finishing Mills Groundwater Phase II Investigation Report (Revision 0 dated November 30, 2016), which were submitted to the agencies for review. An aqueous PAL exceedance figure is provided in **Appendix E** to indicate the locations of any shallow groundwater exceedances from either groundwater investigation.

The groundwater data were screened to determine whether any cumulative (or individual) sample results exceeded the USEPA VI TCR (carcinogen) or THQ (non-carcinogen) Screening Levels. Among the samples obtained during the separate Area B and Finishing Mills Groundwater Investigations, there were no potential VI risks identified from the permanent monitoring wells or temporary groundwater sample collection points located within or proximate to Parcel B21. Total cyanide had previously been identified as a potential VI hazard at several locations, but the screening level for cyanide has since been adjusted upward by the USEPA, eliminating this concern at all but one location (SW-081-MWS). Supplemental sampling has since been conducted at the identified location (outside of the scope of the Finishing Mills Groundwater Investigation) to determine the speciation of cyanide, and the results have indicated that available cyanide is not present at concentrations that could pose a potential VI concern.

6.3. RECOMMENDATIONS

Sufficient remedial investigation data has been collected to evaluate the nature and extent of possible constituents of concern in Parcel B21. The presence and absence of soil impacts within Parcel B21 have been adequately described and further investigation is not warranted to characterize overall conditions. Recommendations for the parcel are as follows:

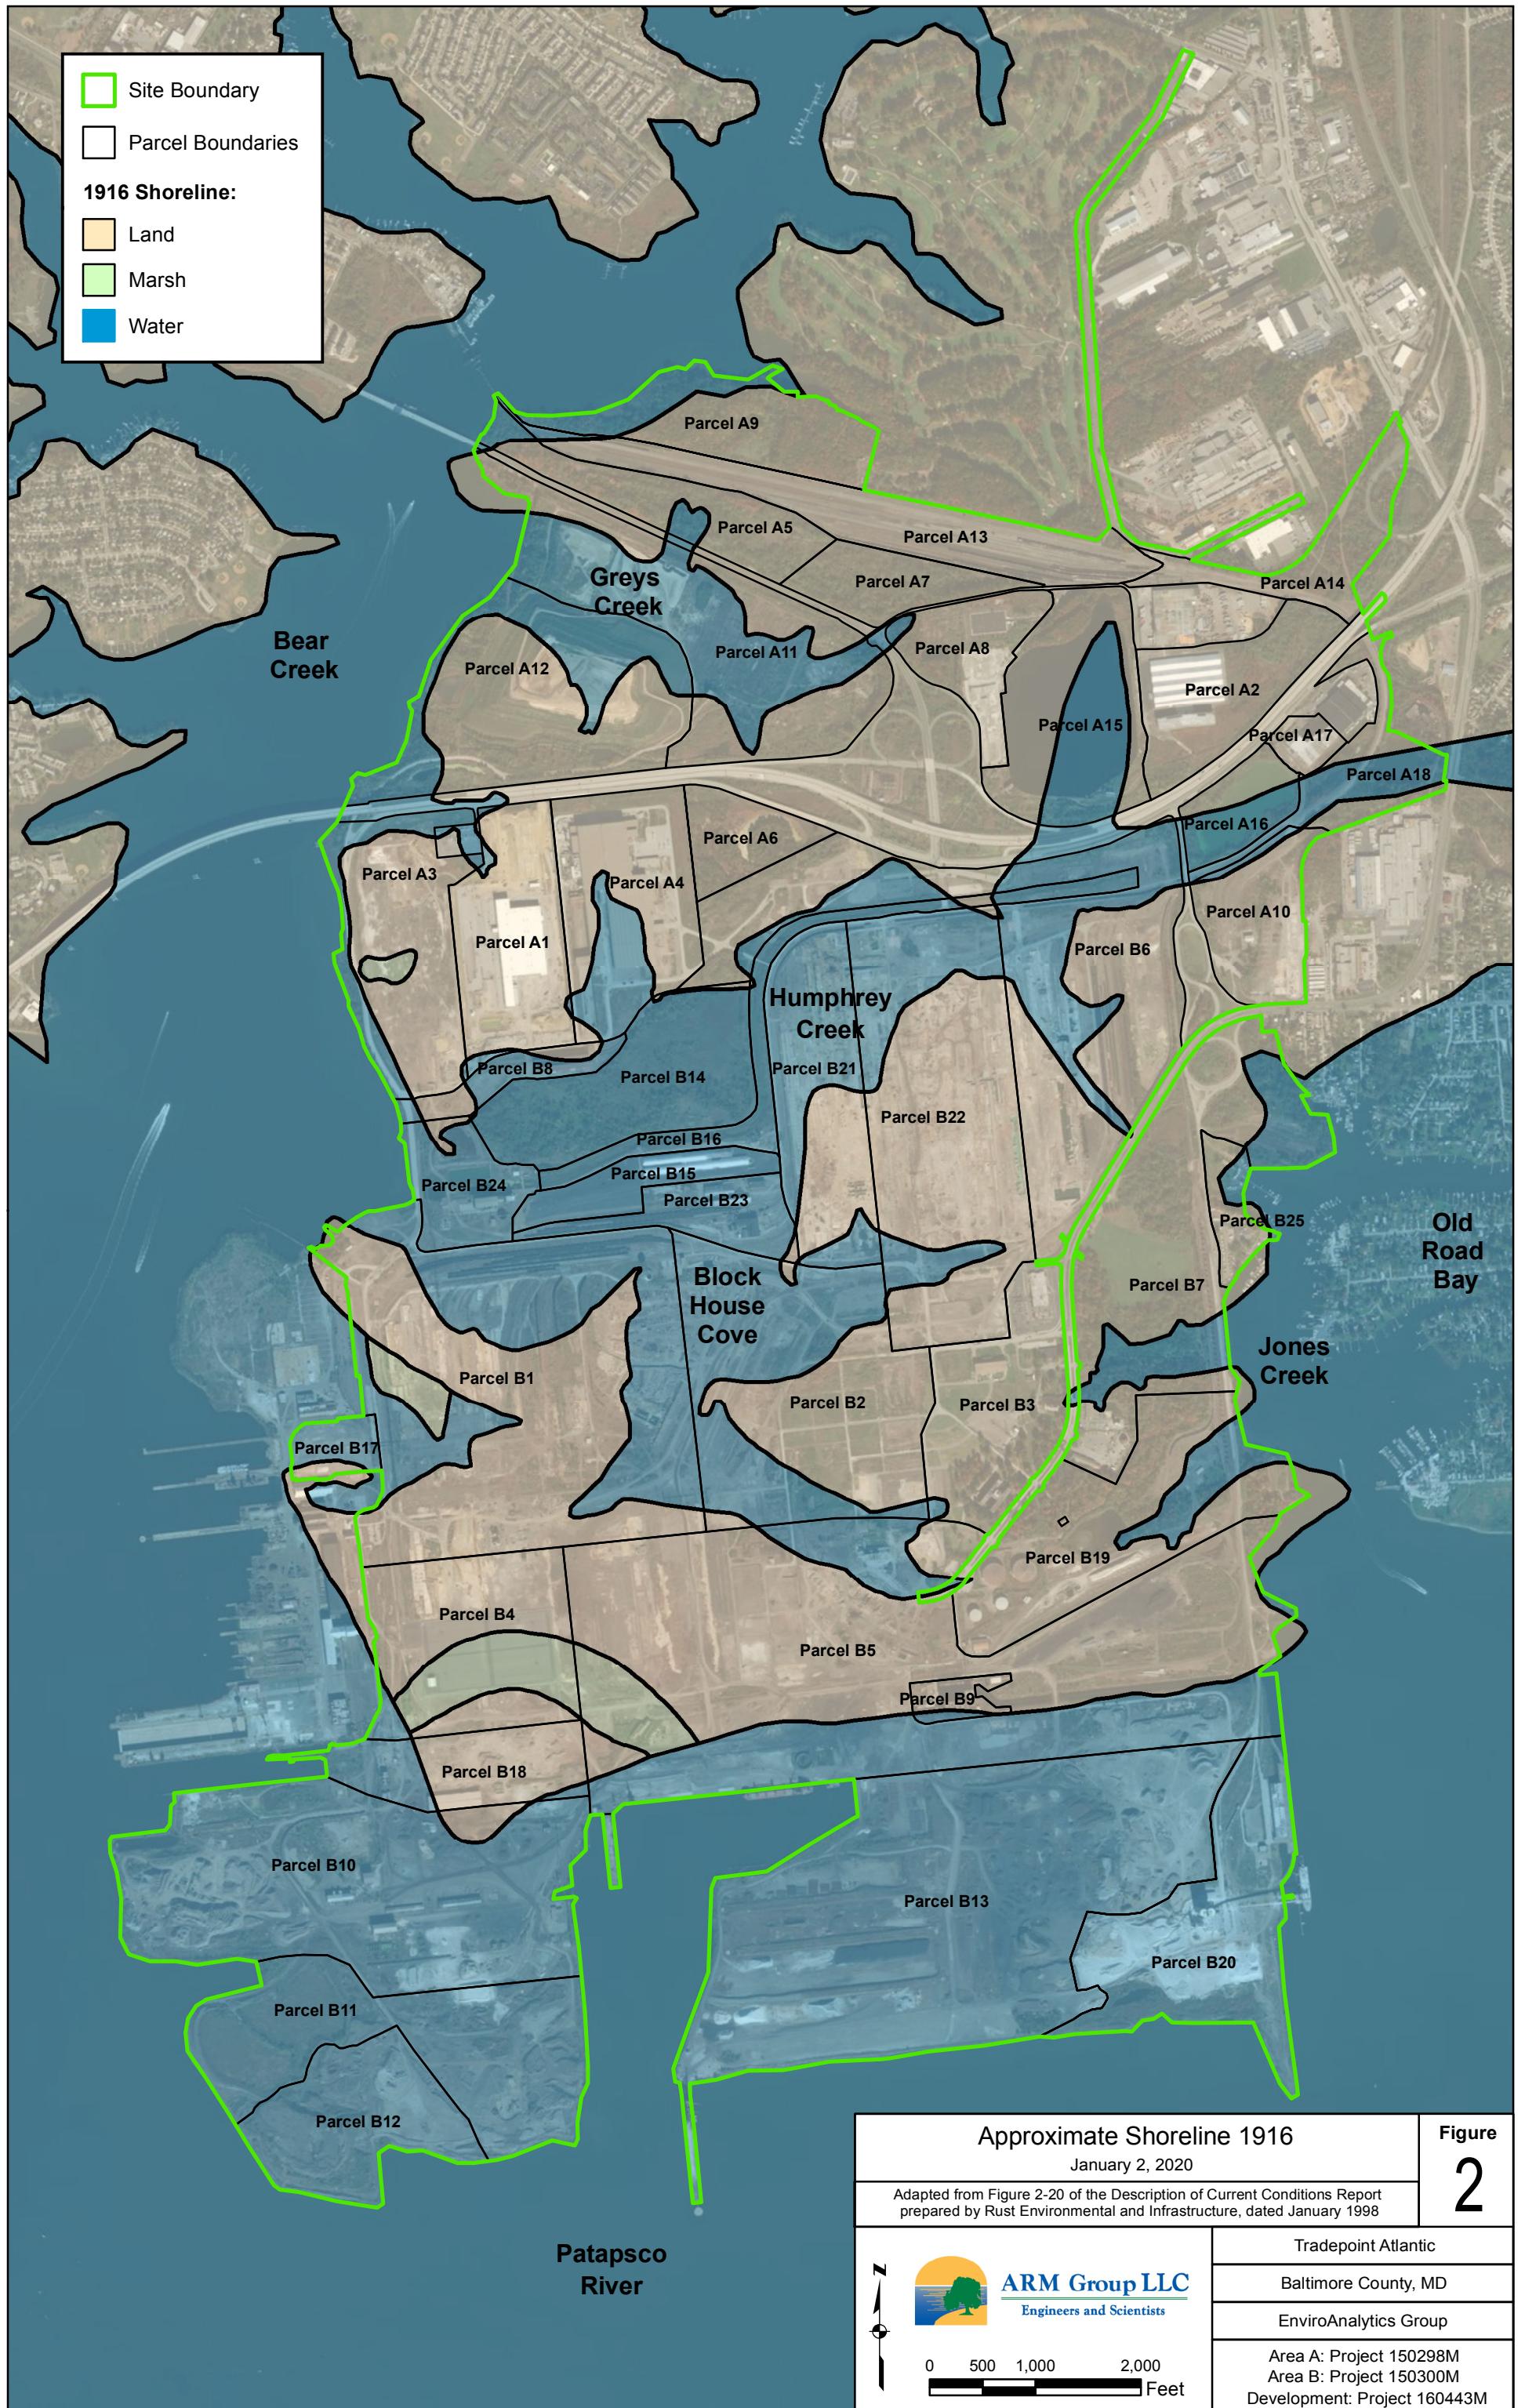

- Soil borings with elevated Oil & Grease concentrations (B21-012-SB and B21-060-SB) should be considered for proximity to proposed utilities in any future development plans. If future utilities are proposed in the vicinity of these borings, appropriate protocols for the mitigation of potential product (NAPL) mobility should be specified in a Response and Development Work Plan.

Detections in bold

Values in red indicate an exceedance of the Project Action Limit (PAL)

N/A indicates that the parameter was not analyzed for this sample

* Indicates non-validated data

U: This analyte was not detected in the sample. The numeric value represents the sample quantitation/detection limit.

UJ: This analyte was not detected in the sample. The actual quantitation/detection limit may be higher than reported.

J: The positive result reported for this analyte is a quantitative estimate.

J-: The positive result reported for this analyte is a quantitative estimate but may be biased low.

B: This analyte was not detected substantially above the level of the associated method blank or field blank.

R: The result for this analyte is unreliable. Additional data is needed to confirm or disprove the presence of this analyte in the sample.

Detections in bold

Values in red indicate an exceedance of the Project Action Limit (PAL)

N/A indicates that the parameter was not analyzed for this sample

* Indicates non-validated data

U: This analyte was not detected in the sample. The numeric value represents the sample quantitation/detection limit.

UJ: This analyte was not detected in the sample. The actual quantitation/detection limit may be higher than reported.

J: The positive result reported for this analyte is a quantitative estimate.

J-: The positive result reported for this analyte is a quantitative estimate but may be biased low.

B: This analyte was not detected substantially above the level of the associated method blank or field blank.

R: The result for this analyte is unreliable. Additional data is needed to confirm or disprove the presence of this analyte in the sample.

Detections in bold

Values in red indicate an exceedance of the Project Action Limit (PAL)

N/A indicates that the parameter was not analyzed for this sample

* Indicates non-validated data

U: This analyte was not detected in the sample. The numeric value represents the sample quantitation/detection limit.

UJ: This analyte was not detected in the sample. The actual quantitation/detection limit may be higher than reported.

J: The positive result reported for this analyte is a quantitative estimate.

J-: The positive result reported for this analyte is a quantitative estimate but may be biased low.

B: This analyte was not detected substantially above the level of the associated method blank or field blank.

R: The result for this analyte is unreliable. Additional data is needed to confirm or disprove the presence of this analyte in the sample.

APPENDIX A

Parcel B21 Sampling Plan Summary
Former Sparrows Point Steel Mill
Sparrows Point, Maryland

Table 1 - Soil Sampling Summary

Source Area/ Description	REC & Finding/ SWMU/ AOC	Figure or Drawing of Reference	RATIONALE	Number of Locations	Sample Locations	Boring Depth	Sample Depth	Analytical Parameters: Soil Samples
Former 1988 PCB Spill Area	AOC B	DCC Figure 3-1/ Drawing 5040	On November 9, 1988, approximately 400 to 450 gallons of PCB oil spilled at the #10 Tin Line, when a transformer fell and ruptured. The area was promptly cleaned, and wipe samples indicated that concentrations were below the applicable cleanup standards. The area was sealed with epoxy paint, and no further action was proposed.	2	B21-001 and B21-002	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (all depths)
Former 1991 Acid Leak Area	AOC I	DCC Figure 3-1	An overflow line leaked acid below process tanks within the Tin Mill into a trench that discharged to the Tin Mill Canal. The line was repaired shortly after the leak was detected, on June 23, 1991. Since the spill was a one-time incident and the leaking line was promptly repaired, no further action was proposed.	2	B21-003 and B21-004	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')
Drip Legs		Drip Leg Drawings 5886B and 5888	Coke oven gas condensate was removed from the gas pipelines at drip legs located throughout the distribution system. The condensate was typically discharged to drums, although it is possible some spilled out of the drums and on to the ground.	2	B21-005 and B21-006	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')
Fuel Shop		Drawing 5045	Investigate potential impacts related to the fuel shop areas (potential leaks or releases).	2	B21-007 and B21-008	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')
Hydraulic Repair Shops (2)		Drawings 5040 and 5140	Investigate potential impacts related to the hydraulic repair shop (potential leaks or releases).	4	B21-009 through B21-012	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')

Table 1 - Soil Sampling Summary

Source Area/ Description	REC & Finding/ SWMU/ AOC	Figure or Drawing of Reference	RATIONALE	Number of Locations	Sample Locations	Boring Depth	Sample Depth	Analytical Parameters: Soil Samples
Oil House		Drawing 5145	Investigate potential impacts related to the oil house (potential leaks or releases).	2	B21-013 and B21-014	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')
Oil Heater		Drawing 5140	Investigate potential impacts related to the oil heater (potential leaks or releases).	2	B21-015 and B21-016	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')
Palm Oil Cooker Aisle		Drawing 5545	Investigate potential impacts related to the palm oil cooker aisle (potential leaks or releases).	2	B21-017 and B21-018	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')
Possible PCB- Contaminated Areas (4)		PCB Site Inventory Data/Map	Investigate potential impacts related to the storage and operation of PCB-containing equipment (potential leaks or releases).	12	B21-019 through B21-030	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')
Chromium Pits		Pit Outlines	Investigate potential impacts related to the chromium pits (potential leaks or releases). Note that the chromium pits are also targeted by multiple additional soil borings completed in the vicinity listed under other sampling targets.	1	B21-031	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')

Table 1 - Soil Sampling Summary

Source Area/ Description	REC & Finding/ SWMU/ AOC	Figure or Drawing of Reference	RATIONALE	Number of Locations	Sample Locations	Boring Depth	Sample Depth	Analytical Parameters: Soil Samples
Halogen Lines Trenches/ Sumps	REC (unidentified), Finding 43/ SWMU 88	DCC Figure 3-1/ Drawing 5545	The Halogen Lines are located in the northwestern corner of the Finishing Mills Area, within the Tin Mill. The trenches/sumps were designed to transport passivation wastewater and spent chemical solutions to the Tin Mill Canal discharge point. Separate trench and sump systems collected different types of discharges. Chromium-bearing wastes were sent to the Chromium HDS Plant, and oily wastewater and rinsewater were discharged to the Tin Mill Canal. Further evaluation was proposed regarding SWMU 88.	6	B21-032 through B21-035, B21-073 and B21-074	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')
Tin Mill Trenches/ Sumps	REC 1R, Finding 39/ SWMU 84	DCC Figure 3-1	The trenches/sumps in the Tin Mill Area were units designed to transport process wastewater to the Tin Mill Canal discharge point. These units consisted primarily of concrete and brick-lined concrete sewers, with some open/box trenches. They managed non-contact cooling water (discharged to the Tin Mill Canal) and pickling process wastewater (discharged to AOC W). Further evaluation was proposed regarding SWMU 84.	3* (2)	B21-036 through B21-038	Total depth of 20 feet or groundwater.	0-1', 4-5', 9-10' bgs. 4-5' interval may be adjusted in the field based on observations or field screening.	VOC^, SVOC, Metals, DRO/GRO, O&G, PCBs (0-1')

Soil Borings Sampling Density Requirements (from **Worksheet 17 - Sampling Design and Rationale**)

No Engineered Barrier (1-15 acres): 1 boring per acre with no less than 3.

Engineered Barrier (41-70 acres): 1 boring per 4 acres with no less than 13.

No Engineered Barrier (9.1 acres) = **10 borings required, 11 completed**

Engineered Barrier (51.4 acres) = **13 borings required, 57 completed**

Parking/Roads (10.2 acres)

Buildings (41.2 acres)

* Soil borings B21-037-SB, B21-041-SB, B21-042-SB, B21-056-SB, B21-061-SB, and B21-062-SB were not able to be completed/sampled. See Phase II Report text for details.

VOC - Volatile Organic Compounds (Target Compound List)

SVOCs - Semivolatile Organic Compounds (Target Compound List)

Metals - (Target Analyte List plus Hexavalent Chromium and Cyanide)

DRO/GRO - Diesel Range Organics/Gasoline Range Organics

O&G - Oil & Grease

PCBs - Polychlorinated Biphenyls

[^]VOCs are only collected if the PID reading exceeds 10 ppm

bgs - Below Ground Surface

Soil samples with a sustained PID reading of 10 ppm or greater were collected for VOCs.
VOC samples were placed in a cooler with a trip blank.
