1.0 INTRODUCTION

This report presents the activities and findings of the 1st semi-annual (Spring) 2024 groundwater monitoring event for the Greys Landfill at the Sparrows Point facility. Groundwater data and analyses are included to fulfill the applicable ongoing groundwater compliance monitoring requirements for the landfill as outlined in the Coke Point and Greys Landfill Sampling Plan letter received from the Maryland Department of the Environment (MDE) on December 3, 2012.

The following data collection activities occurred for the Spring 2024 monitoring event:

- Water level measurements in groundwater monitoring wells;
- Sampling of groundwater monitoring wells; and
- Laboratory analysis of monitoring well samples.

Results of the above investigations are described and presented in this report. This report includes the following:

- location maps for the landfill and the associated monitoring wells;
- water level data collected;
- laboratory reports for sample analyses (included as an electronic attachment);
- discussion of the water quality results;
- groundwater elevation maps for the shallow and intermediate groundwater zones at the landfill; and
- other figures depicting analytical results for this monitoring event.

2.0 SITE AND MONITORING NETWORK DESCRIPTION

Greys Landfill (GLF) occupies approximately 54 acres on the north side of the Sparrows Point property, between I-695 and Peninsula Expressway (**Figure 1**). Based on historic aerial photographs, landfill related operations began in the early 1970s. Slag filling operations were conducted in this area prior to waste disposal operations to provide a level ground surface. The waste disposal operations have consisted predominantly of the landfilling of waste from the previous steel-making operations at the site. Greys Landfill is currently being utilized for ongoing non-hazardous waste disposal associated with the continuing operation of the wastewater treatment facility and site development/remediation activities.

A monitoring well location map is included for the GLF (**Figure 2**). Groundwater is monitored via a series of monitoring wells which are typically arranged in pairs (or clusters) consisting of one shallow well and one or more intermediate depth wells. A total of 32 wells makes up the monitoring well network, consisting of 17 shallow monitoring wells and 15 intermediate monitoring wells. Monitoring well construction details for GLF are presented in **Table 1**. Note, there are 16 existing intermediate monitoring wells; LF-01D is no longer needed for sampling due to the installation of GL-03R (-16).

Shallow wells have been installed to monitor the unconfined shallow groundwater zone. These are considered water table wells. The well screens in the shallow monitoring wells typically span across the ground water table with top-of-screen depths ranging from 4 to 20 feet below ground surface. Intermediate wells have been installed with well screens in deeper layers, with top-of-screen depths ranging from 17 to 45 feet bgs.

GLF monitoring wells GL-03 (-3), and GL-03 (-16) were abandoned prior to the Fall 2021 monitoring event to accommodate construction in the area east of GLF. The proposed development and well abandonments were detailed in the Sub-Parcel A11-2 Response and Development Work Plan (Revision 0 dated March 11, 2021). LF-01 and GL-03 (-3) are in close proximity to each other and have similar screen intervals; therefore LF-01 has been utilized as a replacement well for GL-03 (-3). LF-01D was temporarily sampled as a replacement well for GL-03 (-16). Monitoring Wells GL-18 (-3) and GL-18 (-33) were abandoned in March 2023 due to development activities.

In March 2024, replacement wells were installed for the following monitoring wells: GL-03 (-16), GL-18 (-3) and GL-18 (-33). Monitoring wells GL-18R (-3) and GL-18R (-33) were installed to have the same screen elevation interval as the original wells, while intermediate well GL-03R (-16) was installed with a deeper screened interval (29' – 39' bgs) than the original, based on the lithology identified during drilling. Each of the replacement wells was given the same well name as the original with the addition of an 'R' after the first portion of the name to distinguish it from the original (ex. GL-18R (-3)). With the installation of the new replacement wells, LF-01D will no longer be sampled going forward. Refer to **Appendix A** for the monitoring well installation logs.

3.0 GROUNDWATER MONITORING PROCEDURES

3.1 SAMPLING EVENT

Between April and May 2024, samples were collected from 32 wells at GLF for the Spring 2024 monitoring event. The locations of the monitoring wells are shown in **Figure 2**. A summary of construction details for GLF monitoring wells is presented in **Table 1**.

Analytical parameters for groundwater samples were specified in the December 3, 2012, MDE letter and included Table I (VOCs) and Table II (elements and indicator) parameters. In addition, the groundwater monitoring well samples were analyzed for SVOCs based on notable detections of SVOCs historically at the landfill. Analyses were performed by Alpha Analytical (Alpha) using EPA methods (Pace Analytical, Inc. has since bought Alpha).

Data summary tables presenting monitoring well groundwater analytical results in time-series format are presented in **Appendix B** (Table I VOCs), **Appendix C** (SVOCs), and **Appendix D** (Inorganics). A summary of data qualifiers shown in **Appendix B** through **Appendix D** is presented in a data qualifier index table, included as **Appendix E**.

3.2 GROUNDWATER SAMPLING PROCEDURES

Groundwater levels were measured at each monitoring well on April 15th, 2024. Water levels were measured to the nearest 0.01-foot with an electronic water level probe. Water levels were referenced to the top of the inner casing of the wells. Data for groundwater levels as collected during the Spring 2024 monitoring event are tabulated in **Table 2** for GLF.

Groundwater samples were collected using the low-flow sampling methodology stated within the Standard Operating Procedure (No. 007) included in the Quality Assurance Project Plan. An electrical peristaltic pump with dedicated disposable tubing was used to purge each monitoring well. Purging continued until field water quality parameters pH, temperature, dissolved oxygen, specific conductance, and oxidation-reduction potential were stable. These water quality parameters were monitored during purging using a Horiba U-50 multi-parameter water quality meter and flow-through cell. A measurement for each water quality parameter was recorded every five minutes. After three consecutive measurements indicated stability (variance between consecutive measurements was within parameter-specific range), the sample was collected.

Groundwater samples were collected in laboratory-provided containers and were properly labeled. Care was taken to control flow rates so as to not over-fill sample containers that had a preservative. A chain of custody form was completed indicating sample number, date, time, and the analyses required. Samples were stored on ice in a cooler and shipped to Alpha for analysis. Laboratory Certificates of Analysis and Chain of Custody forms are included as an Electronic Attachment.

4.0 GROUNDWATER ELEVATION DATA EVALUATION

Depth to water measurements and groundwater monitoring well survey data were used to calculate groundwater elevations and develop groundwater elevation maps for the landfill. One groundwater elevation map was developed for the shallow groundwater zone, and a second map was developed for the intermediate depth groundwater zone.

Groundwater elevations for GLF monitoring wells measured during the Spring 2024 monitoring event and are presented in **Table 2**. These data were incorporated into groundwater elevation maps for the shallow groundwater zone (**Figure 3**) and the intermediate groundwater zone (**Figure 4**). Vertical survey data are referenced to the North American Vertical Datum of 1988. The monitoring wells installed in March 2024 (GL-03R (-16), GL-18R (-3) and GL-18R (-33)) have not been surveyed; they are not included in the groundwater elevation maps.

Figure 3 shows groundwater levels measured in the shallow zone monitoring wells. Groundwater elevations in shallow zone monitoring wells ranged from 1.37 feet above mean sea level (AMSL) at LF-01 to 14.56 feet AMSL at GL-13 (+1). Shallow groundwater elevations are lower on the north side of Greys Landfill and along the western portion, adjacent to the shoreline. Shallow groundwater appears to be flowing towards the north and west.

Groundwater elevations for the intermediate wells are shown in **Figure 4**. Excluding GL-09 (-20), groundwater elevations in intermediate wells ranged from 0.78 feet AMSL in GL-15 (-36) to 1.94 feet AMSL in GL-11 (-33). Because of this relatively small range, only the values are illustrated, and the groundwater contours are not presented on **Figure 4**. The highest groundwater elevation in the intermediate zone was measured at well GL-09 (-20) (groundwater elevation of 6.59 feet AMSL). However, the groundwater level at GL-09 (-20) is an anomaly when compared to the other wells in the intermediate zone, which generally have deeper groundwater elevations. Between Spring 2020 and Spring 2024, the groundwater elevation of GL-09 (-20) ranged from 4.67 to 6.59 feet AMSL.

5.0 MONITORING EVENT AND STATISTICAL TREND ANALYSIS

Analytical data from groundwater samples have been tabulated and evaluated with respect to applicable Project Action Limits (PALs) as per the Quality Assurance Project Plan (QAPP) (Revision 4 dated May 31, 2022). An interpretive discussion of the findings is provided in the following subsections. All historical results were subject to a statistical evaluation which consisted of analyzing the data for statistically significant trends over time.

Groundwater samples were collected from 16 of the 17 shallow monitoring wells, and from 16 intermediate monitoring wells (the 15 included in the intermediate zone network and LF-01D). Note, a groundwater sample was inadvertently collected from intermediate monitoring well LF-01D (no longer included in the sampling network due to the installation of GL-03R (-16)) instead of shallow monitoring well LF-01.

5.1 GROUNDWATER QUALITY EVALUATION

5.1.1 VOCS

Spring 2024 and historical VOC results for GLF monitoring wells are presented in **Appendix B**. VOC PAL exceedances from the Spring 2024 monitoring event are shown in **Figure 5** (shallow zone) and **Figure 6** (intermediate zone). Refer to **Table 3** for a summary of VOCs detected in groundwater.

Benzene was detected above its PAL (5 µg/L) at seven of the 16 shallow monitoring wells, with the maximum benzene concentration of 4,400 µg/L at GL-17 (-1), located along the northern perimeter of GLF. Groundwater in the shallow zone near GL-17 (-1) flows to the northwest. It is evident from the concentrations displayed on **Figure 5** that VOC impact is significantly attenuated with distance from the landfill in the shallow zone in the downgradient direction. There is a decrease in benzene concentrations from well GL-17 (-1) (4,400 µg/L) to downgradient wells GL-19 (430 µg/L), GL-02 (-5) (36 µg/L), and TS-01 (-7) (11 µg/L). Refer to **Figure 7** for historic benzene concentrations in GL-17 (-1).

Across all shallow monitoring wells, only four other VOCs (1,1-dichloroethane, 1,4-dioxane, tetrachloroethene, and vinyl chloride) exceeded their PALs. 1,1-dichloroethane was detected above its PAL (2.7 µg/L) at three shallow monitoring wells: GL-02 (-5) (44 µg/L), GL-20 (-5) (2.9 µg/L), and TS-01 (-7) (4 µg/L). 1,4-dioxane was detected above its PAL (0.46 µg/L) in nine shallow monitoring wells at concentrations ranging from 1.1 µg/L (GL-10 (-1)) to 62 µg/L (GL-08 (-3)). Tetrachloroethene (PCE) was detected at a concentration equal to its PAL (5 µg/L) in GL-19, and vinyl chloride was detected above its PAL (2 µg/L) in GL-02 (-5) (4.2 µg/L). There are minimal VOC PAL exceedances along the southern perimeter of the landfill and to the west of the landfill (adjacent to Bear Creek) as shown on **Figure 5**.

VOC results from the Spring 2024 monitoring event are shown for the intermediate groundwater monitoring wells at GLF on **Figure 6**. For the intermediate zone, the only VOC to exceed its PAL was 1,4-dioxane. 1,4-dioxane was detected at concentrations above its PAL (0.46 µg/L) in 10 of 16 intermediate wells with concentrations ranging from 1.5 µg/L (GL-16 (-32)) to 54 µg/L (GL-17 (-31)).

It should be noted that 1,4-dioxane was not included in VOC analysis prior to November 2022 (when sample analysis was shifted from Pace Analytical Inc. to Alpha). 1,4-Dioxane concentrations since the November 2022 sampling events are included in the VOC historical dataset used for statistical trend analysis and included in **Appendix B**. Going forward, 1,4-dioxane will be included in the VOC analyte list. These PAL exceedances do not represent an increase in concentrations, but rather the inclusion of a new parameter in the VOC analyte list.

5.1.2 SVOCs

Spring 2024 and historical SVOC results for GLF are presented in **Appendix C**. SVOCs are not listed as part of the Table I and Table II requirements outlined in the December 3, 2012, letter; however, monitoring wells were analyzed for SVOCs based on recommendations from a previous groundwater compliance report for GLF published in 2011. SVOC results from the Spring 2024 monitoring event for GLF are displayed in **Figure 5** (shallow zone) and **Figure 6** (intermediate zone). Refer to **Table 3** for a summary of SVOCs detected in groundwater.

Four different SVOCs (1,1-biphenyl, benz[a]anthracene, naphthalene, and pentachlorophenol) were detected above their respective PALs in the shallow groundwater, with seven shallow monitoring wells exceeding the PAL for one or more SVOC. Naphthalene was the most widespread, exceeding its PAL (0.12 µg/L) in eight shallow monitoring wells. Spring 2024 naphthalene concentrations ranged from 0.5 µg/L in TS-01 (-7) to 510 µg/L in well GL-08 (-3). Naphthalene concentrations for GL-08 (-3) have fluctuated over the past several years as shown on **Figure 8**; the Spring 2024 naphthalene concentration is on the lower end of the historical range. Pentachlorophenol and benz[a]anthracene both exceeded their PALs (1 µg/L and 0.03 µg/L, respectively) in three shallow monitoring wells. The maximum pentachlorophenol concentration in the shallow zone was detected at well GL-08 (-3) with a concentration of 2.4 µg/L. The maximum benz[a]anthracene concentration in the shallow zone was detected at well GL-18R (-3) with a concentration of 0.19 µg/L. One other SVOC exceeded its PALs: 1,1-biphenyl exceeded its PAL of 0.83 µg/L in well GL-08 (-3) (1.8 J µg/L)

In the intermediate zone, benz[a]anthracene was the most prevalent SVOC, exceeding its PAL (0.03 µg/L) in four wells. Benz[a]anthracene concentrations in the intermediate zone range from an estimated 0.03 µg/L in GL-12 (-17) to 0.07 µg/L in well GL-18R (-33). Naphthalene was detected above its PAL (0.12 µg/L) in three intermediate wells, with concentrations ranging from 0.16 µg/L in GL-10 (-31) to 6.8 µg/L in GL-18R (-33). Dibenz[a,h]anthracene was detected above its PAL (0.025 µg/L) in well GL-16 (-32) at a concentration of 0.05 J µg/L.

5.1.3 Inorganics

Spring 2024 and historical inorganic compound data for GLF are presented in **Appendix D**. Individual results for inorganic compounds that exceeded their respective PAL are displayed on **Figure 9** (shallow zone) and **Figure 10** (intermediate zone). Iron, manganese, and cobalt were among the inorganic compounds detected that exceeded their respective PALs in both the shallow and intermediate ground water zones and are considered to be related to the slag fill utilized historically throughout Sparrows Point. Refer to **Table 4** for a summary of inorganics detected in groundwater.

Figure 9 shows that seven inorganics (arsenic, beryllium, cobalt, iron, lead, manganese, and selenium) exceeded their respective PALs in the shallow groundwater zone. The wells that exhibited the most exceedances were GL-05 (-7), GL-10 (-1) and GL-16 (-6). Cobalt was the most widespread, detected above its PAL (6 µg/L) in five of 16 shallow monitoring wells, ranging from 10.85 µg/L (GL-10 (-1)) to 262 µg/L (GL-16 (-6)). Manganese was detected above its PAL (430 µg/L) in four shallow wells at concentrations ranging from 676 µg/L (GL-12 (-3)) to 1,108 µg/L (GL-10 (-1)). Iron was detected above its PAL (14,000 µg/L) in three shallow wells, with concentrations ranging from 14,900 µg/L (GL-16 (-6)) to 204,000 µg/L (GL-10 (-1)). Arsenic was also detected above its PAL (10 µg/L) in three shallow wells, at concentrations ranging from 11.23 µg/L (GL-08 (-3)) to 18.58 µg/L (GL-09 (-2)). The remaining three inorganic parameters (beryllium, lead, and selenium) were detected above their PALs in only one shallow well each. Beryllium was detected above its PAL (4 µg/L) in GL-16 (-6) (4.12 µg/L), lead was detected above its PAL (15 µg/L) in GL-19 (30.86 µg/L), and selenium was detected above its PAL (50 µg/L) in GL-15 (-6) (109 µg/L). Historic groundwater concentrations of cobalt, iron, and manganese in select shallow wells have been presented within **Figures 11, 12, and 13** along with the associated PALs.

As shown on **Figure 10**, four inorganics (arsenic, cobalt, iron, and manganese) exceeded their PALs in the intermediate groundwater zone. Iron and manganese were the most prevalent inorganics detected above their respective PALs in 12 of 15 intermediate groundwater wells. Concentrations of iron ranged from 16,000 µg/L (GL-10 (-31)) to 839,000 µg/L (GL-13 (-36)). Concentrations of manganese ranged from 497 µg/L (GL-15 (-36)) to 98,370 µg/L (GL-13 (-36)). Cobalt was detected above its PAL in four shallow wells, ranging from 31.22 µg/L (LF-01D) to 55.72 µg/L (GL-03R (-16)). Arsenic was detected above its PAL in the three intermediate wells, ranging from 11.68 µg/L (GL-03R (-16)) to 35.73 µg/L (GL-09 (-20)).

Overall, these parameters have historically been identified at elevated levels. The Spring 2024 concentrations were all within the historical ranges.

5.2 STATISTICAL EVALUATION – TREND ANALYSIS

For the purpose of evaluating the distribution of parameter concentrations over time, parameters were subjected to a trend analysis. Trend analysis was performed for any parameter exceeding its PAL during the Spring 2024 event, which also had at least four samples. The trend analysis involved performance of the Mann-Kendall test.

The Mann-Kendall test is a non-parametric test for identifying linear trends in data. The test is suitable for non-normally distributed data and is not limited by sample size. The test pairs measurements and assigns a score to each possible pair based on comparing the average of the pair in question to the average of a pair of earlier measurements. If the average of a particular pair of measurements is lower than the average of an earlier pair, it is assigned a score of -1; if it is tied it, is assigned a score of 0; and if it is higher, it is assigned a score of 1. The sum of these scores is computed to obtain the Mann-Kendall Statistic (S). If S is positive, it implies an upward trend over time; if it is negative, it implies a downward trend over time; and an S value near zero roughly indicates that there is no apparent trend in data. As the absolute value of S gets larger, the stronger the evidence for a real increasing or decreasing trend. For larger data sets (greater than 10), the behavior of S tends to approximate a normal distribution in accordance with the central limit theorem, and a standardized statistic, Z, is used for trend identification. For higher levels of significance, the larger the absolute value of Z or S needs to be to conclude the presence of a trend in data over time. A significance level of 95 percent was used for all Mann-Kendall Tests performed for this evaluation. Data points that were below the detection limits were replaced with the laboratory reporting limit divided by two. Monitoring wells LF-01 and LF-01D were excluded from the trend analysis as they have too few samples.

Statistical analyses were performed using the ChemStat® statistical analysis software (version 6.3.0.2, Starpoint Software, Inc., ©1996-2013). The ChemStat® input and output files are included as an Electronic Attachment. When using the Mann-Kendall test, ChemStat® identifies trends as either increasing trends, decreasing trends, or no trend (which does not indicate a stable trend, but rather the absence of a statistically significant increasing or decreasing trend).

5.2.1 Statistical Trends

Statistically significant trends identified for GLF wells in which the parameter also exceeded its PAL during the Spring 2024 event are shown on **Table 5**. If no statistically significant trend was identified for a parameter that exceeded its PAL, it is not shown in **Table 5**. For the parameters selected for trend testing, all historical sampling dates were included in the statistical trend analysis. Some GLF well data extend back to 2009. Trend test results are summarized below.

In shallow zone wells there were five parameters (that exceeded their PAL) identified with statistically significant upward trends. Of the five parameters with statistically significant upward trends identified for shallow zone wells, there were two VOCs (1,1-dichloroethane and vinyl

chloride), one SVOC (naphthalene), and two inorganic parameters (beryllium and manganese). These upward trends were spread across six shallow zone wells. Two upward trends were identified in GL-02 (-5) (1,1-dichloroethane and vinyl chloride) and GL-16 (-6) (beryllium and manganese). One upward trend was identified in GL-09 (-2) (naphthalene), GL-12 (-3) (manganese), GL-17 (-1) (naphthalene), and GL-20 (-5) (naphthalene).

In shallow wells, there were seven parameters (that exceeded their PAL) identified with statistically significant downward trends. Of the seven parameters with downward trends identified for shallow zone wells, there were two VOCs (benzene and PCE), two SVOCs (benz[a]anthracene and naphthalene), and three inorganic parameters (cobalt, iron, and manganese). These downward trends were spread across seven of the 15 shallow wells. The well with the most downward trends was GL-05 (-7) with two (cobalt and manganese) while the remaining six shallow wells [GL-08 (-3), GL-11 (-1), GL-17 (-1), GL-19, GL-20 (-5), TS-01 (-7)] only had one downward trend each.

In the intermediate zone, there were three parameters (that exceeded their PAL) identified with statistically significant upward trends. All three parameters with statistically significant upward trends identified for the intermediate zone wells were inorganic parameters (cobalt, iron, and manganese). These upward trends were spread across six intermediate wells. Well GL-10 (-31) had two upwards trends, while the remaining wells [GL-02 (-29), GL-08 (-36), GL-13 (-26), GL-14 (-33), and GL-16 (-32)] only had one.

In the intermediate zone, there were three parameters (that exceeded their PAL) identified with statistically significant downward trends. Of the three parameters with statistically significant downward trends for the intermediate zone wells, one was an SVOC (naphthalene) and two were inorganic parameters (iron and manganese). These downward trends were spread across five intermediate wells. The well with the most downward trends was GL-12 (-17) with two. Wells GL-02 (-29), GL-08 (-36), GL-09 (-20), and GL-10 (-31) each had one downward trend.

For the shallow and intermediate monitoring wells along the shoreline of Bear Creek, there were no statistically significant increasing trends identified for benzene and naphthalene. An upward trend was identified for vinyl chloride in shoreline monitoring well GL-02 (-5). The detected concentration of 4.2 µg/L was within the historical range for the monitoring well and was less than one magnitude above the PAL (2.0 µg/L). Shoreline monitoring well GL-02 (-5) also identified an upwards trend for 1,1-dichloroethane with a detected concertation of 44 µg/L, which was within the historical range for this monitoring well.

6.0 RECOMMENDATIONS

Based on the results of this groundwater monitoring program for the GLF, the VOCs detected in shallow groundwater are related to the historical operations in the area (including landfill operations, localized filling, and A11 related activities), while the metal impacts in the intermediate groundwater are likely associated with the slag fill material that was initially placed in the area.

The maximum benzene and naphthalene concentrations in the shallow groundwater zone were identified in GL-17 (-1) and GL-08 (-3), respectively; both wells are located along the northern boundary of the landfill. Benzene and naphthalene concentrations in shoreline monitoring wells (where detected) were significantly lower than the concentrations detected further upgradient. In addition, there were no increasing trends identified for benzene and naphthalene for the shallow and intermediate monitoring wells along the shoreline. An upward trend was identified for vinyl chloride in shoreline monitoring well GL-02 (-5). The detected concentration of 4.2 µg/L was within the historical range for the monitoring well and was less than one magnitude above the PAL (2.0 µg/L). Shoreline monitoring well GL-02 (-5) also identified an upwards trend for 1,1-dichloroethane with a detected concentration of 44 µg/L, which was within the historical range for this monitoring well. Trends within these shoreline monitoring wells are being analyzed within the Site-Wide Groundwater Corrective Measures Study that will be submitted in the Fall of 2024.

The existing groundwater monitoring wells are adequately located to monitor impacts to both shallow and intermediate groundwater zones around the landfill. Semi-annual groundwater monitoring events will continue to be performed to sample and analyze groundwater quality in the area of the GLF. All trends will continue to be monitored in future sampling events. Groundwater results and trend analysis of the existing monitoring well network will be included within the Second Half 2024 Groundwater Monitoring Report.

Bold indicates detection

Values in red indicate a detection exceedance of the Project Action Limit (PAL)

J: The positive result reported for this analyte is a quantitative estimate.

U: This analyte was not detected in the sample. The numeric value represents the sample quantitation/detection limit.

B: This analyte was not detected substantially above the level of the associated method blank/preparation or field blank.

Table 5
Greys Landfill
Statistically Significant Trend Summary

Zone	Well ID	Parameter Name	Statistical Trend
Shallow	GL-02 (-5)	1,1-Dichloroethane	Upward
		Vinyl Chloride	Upward
	GL-05 (-7)	Total Cobalt	Downward
		Total Manganese	Downward
	GL-08 (-3)	Benzene	Downward
	GL-09 (-2)	Naphthalene	Upward
	GL-11 (-1)	Total Cobalt	Downward
	GL-12 (-3)	Total Manganese	Upward
		Total Beryllium	Upward
	GL-16 (-6)	Total Manganese	Upward
		Total Manganese	Upward
	GL-17 (-1)	Benzene	Downward
		Naphthalene	Upward
	GL-19	Tetrachloroethene	Downward
	GL-20 (-5)	Benz[a]anthracene	Downward
Naphthalene		Upward	
TS-01 (-7)	Naphthalene	Downward	
Intermediate	GL-02 (-29)	Total Iron	Upward
		Naphthalene	Downward
	GL-08 (-36)	Total Cobalt	Upward
		Total Manganese	Downward
	GL-09 (-20)	Total Manganese	Downward
	GL-10 (-31)	Total Iron	Upward
		Total Manganese	Upward
		Naphthalene	Downward
	GL-12 (-17)	Total Iron	Downward
		Total Manganese	Downward
GL-13 (-26)	Total Iron	Upward	
GL-14 (-33)	Total Manganese	Upward	
GL-16 (-32)	Total Iron	Upward	

Note: All parameters exceeding their project action limit during this sampling event underwent trend testing. If the result of the testing was that no upward or downward trend was identified for a parameter at a particular well, it was not included in this table.

 Client : Tradepoint Atlantic
 Site : Sparrows Point
 Borehole Location : Greys Landfill
 ARM Representative : L. Parker G.I.T.
 Checked by : S. Lowe G.I.T.
 Drilling Company : KIM Engineering
 Driller : Wes
 Drilling Equipment : Geoprobe 55 Auger

Northing (ft) : 574300
 Easting (ft) : 1458909
 Date/Time Completed : 3/18/2024
 Surf. Elev. (ft AMSL) :
 TOC Elev. (ft AMSL) :
 PVC Stick-up (ft) : 2.5' ags
 Total Well Depth (ft) : 52.5' TOC
 Depth to Water (ft) : 0 hr: 20.89' TOC
 Borehole Diameter (in.) : 6

Well ID: GL-18R (-33)

(page 3 of 3)

Depth (ft.)	%Recovery	PID (ppm)	DESCRIPTION	REMARKS
40		0.0	(40-42') NATIVE Gray CLAY with some SAND and GRAVEL, medium to coarse, soft, low cohesion, low plasticity (MOIST)	 <p>Filter Pack: FilPro W.G. #2 Sand</p> <p>Screen: 2" diameter Schedule 40 PVC 0.02" slot size</p>
41	100	0.0		
42			(42-45') No Recovery	
43				
44				
45		0.0	(45-45.5') NATIVE Gray CLAYEY SILT and CLAY with wood, soft, low cohesion, low plasticity (MOSIT to WET)	
46	100	0.0	(45.5-46.5') NATIVE Brown to gray SILTY SAND to SANDY SILT, trace black peat, medium dense, fine to medium, low cohesion, no plasticity (DAMP)	
47			(46.5-47') NATIVE Gray SILTY SAND, semi-loose, some GRAVEL, trace wood, low to no cohesion, no plasticity (WET)	
48			(47-50') No Recovery	
49			(50-50.1') NATIVE SAND, light brown, fine to medium, loose (DAMP)	
50		0.0	(50.1-50.8') NATIVE Gray SILT and SAND, soft, no to low cohesion, no plasticity (WET)	
51	95	0.0	(50.8-51') NATIVE Brown and gray SANDY SILT, medium dense, low cohesion, no plasticity (DAMP)	
52			(51-52') NATIVE Gray to light brown SILTY SAND with lenses of SILT, medium dense, low to no cohesion, no plasticity (MOIST to DAMP)	
53			End of Boring

APPENDIX E

Appendix D - Data Qualifiers Index

Data Qualifier	Definition
1c	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
2c	The read back of the low concentration calibration standard for this compound is not within 30% of the true value. The results may be biased high and should be considered estimated.
3c	The read back of the low concentration calibration standard for this compound is not within 30% of the true value. The results may be biased low and should be considered estimated.
4c	Sample volume was reduced so the sample could be within an acceptable range
5c	The read back of the low concentration calibration standard for this compound is not within 30% of the true value. The results may be biased low and should be considered estimated.
B	Analyte was detected in the associated method blank.
c2	Acid preservation may not be appropriate for the analysis of 2-Chloroethylvinyl ether.
CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
D4	Sample was diluted due to the presence of high levels of target analytes.
E	Analyte concentration exceeded the calibration range. The reported result is estimated.
ED	Due to the extract's physical characteristics, the analysis was performed at dilution.
H3	Sample was received or analysis requested beyond the recognized method holding time.
H6	Analysis initiated outside of the 15 minute EPA required holding time.
IH	This analyte exceeded secondary source verification criteria high for the initial calibration. The reported results should be considered an estimated value.
IL	This analyte exceeded secondary source verification criteria low for the initial calibration. The reported results should be considered an estimated value.
L1	Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
M5	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
M6	Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.
P6	Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.
R1	RPD value was outside control limits.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.
