1.0 INTRODUCTION

This report presents the groundwater monitoring activities and findings for the first half 2026 event for the Greys Landfill (GLF) at the Sparrows Point facility. Semi-annual groundwater sampling activities, and the related data compilation/analyses are reported herein to fulfill the applicable compliance requirements for the landfill as outlined in the Coke Point and Greys Landfill Sampling Plan letter received from the Maryland Department of the Environment (MDE) on December 3, 2012.

The following GLF data collection activities occurred for the first half 2026 monitoring event:

- Water level measurements in groundwater monitoring wells;
- Sampling of groundwater monitoring wells; and
- Laboratory analysis of monitoring well samples.

Results of the above GLF investigation activities are described and presented in this report, including:

- Location maps for the landfill and the associated monitoring wells
- Groundwater elevation data
- Laboratory analytical reports (included as an electronic attachment)
- Discussion of analytical results
- Updated Mann-Kendall trend analyses
- Groundwater elevation maps for the shallow and intermediate groundwater zones at the landfill, and
- Other figures displaying analytical results

2.0 SITE AND MONITORING NETWORK DESCRIPTION

GLF occupies approximately 54 acres on the north side of the Sparrows Point property, between I-695 and Peninsula Expressway (**Figure 1**). Based on historic aerial photographs, landfill related operations began in the early 1970s. Slag filling operations were conducted in this area prior to waste disposal operations to provide a level ground surface. Waste disposal operations consisted predominantly of landfilling waste from previous steel-making operations at the site. GLF is currently used for ongoing non-hazardous waste disposal associated with continuing operation of the wastewater treatment facility and site development/remediation activities.

A monitoring well location map is included for the GLF as **Figure 2**. Groundwater is monitored via a series of monitoring wells which are typically arranged in pairs (or clusters) consisting of one shallow well and one or more intermediate depth wells. A total of 32 wells make up the monitoring well network, consisting of 17 shallow monitoring wells and 15 intermediate monitoring wells. Monitoring well construction details for GLF are presented in **Table 1**. Note, there are 16 existing intermediate monitoring wells; LF-01D is no longer needed for sampling due to the installation of GL-03R (-16). LF-01D will be proposed for abandonment in the Sitewide Groundwater Monitoring Network Plan (to be submitted with the Sitewide Groundwater Corrective Measures Study).

A total of 17 shallow wells exist to monitor the unconfined shallow groundwater zone. These are water table wells with well screens typically extending across the groundwater table with top-of-screen depths ranging from 4 to 20 feet below ground surface (bgs). A total of 15 intermediate wells exist with top-of-screen depths ranging from 16 to 45 feet bgs.

3.0 GROUNDWATER MONITORING PROCEDURES

3.1 SAMPLING EVENT

In May 2026, samples were collected from 31 wells at GLF for the first half 2026 monitoring event. Monitoring well GL-05 (-25) has a bent casing, and the measured depth was significantly shallower than the installed depth. Groundwater was not encountered and TPA is planning to replace GL-05 (-25). Monitoring well locations are shown in **Figure 2**. A summary of well construction details is presented in **Table 1**.

Analytical parameters for GLF groundwater samples were specified in a December 3, 2012, MDE letter. The letter includes Table I - Volatile Organic Compounds (VOCs) and Table II - elements and indicator parameters. In addition, groundwater samples were analyzed for Semi-Volatile Organic Compounds (SVOCs) based on historical detections of SVOCs at GLF. SVOCs were not listed as part of Table I and Table II in the December 3, 2012, letter. Laboratory analyses were performed by Pace Analytical, Inc. using methods approved by the Environmental Protection Agency.

Data tables presenting the groundwater analytical results in time-series format are presented in **Appendix A** (VOCs), **Appendix B** (SVOCs), and **Appendix C** (Inorganics). A data qualifier index table is included as **Appendix D**.

3.2 GROUNDWATER SAMPLING PROCEDURES

A synoptic gauging event was completed on May 5, 2026. The depth to groundwater from top-of-casing was measured for GLF monitoring wells using an electronic interface probe. The related data are tabulated in **Table 2**.

Groundwater gauging and sampling was completed by S & S Technologies Inc. S & S conducted the low-flow sampling consistent with Standard Operating Procedure No. 007, included in the Quality Assurance Project Plan. An electrical peristaltic pump with dedicated tubing was used to purge each monitoring well. Purging continued until field water quality parameters (pH, temperature, dissolved oxygen, specific conductance, and oxidation-reduction potential) were stable. Water quality parameters were monitored using a Horiba U-52 water quality meter and flow-through cell. Water quality parameters were recorded every five minutes. Once three stable consecutive measurements were obtained (based on parameter-specific ranges), the groundwater sample was collected.

Trace non-aqueous phase liquid (NAPL) was identified in monitoring well GL-20 (-5) (refer to **Section 5.3** for more details). A no-purge grab sample was collected from this location due to the presence of NAPL.

Groundwater samples were collected in labeled laboratory-provided containers. A chain of custody form was completed indicating sample number, date, time, and the analyses required. Samples were stored on ice in a cooler and shipped to Pace for analysis. Laboratory Certificates of Analysis including Chain of Custody forms are provided as an Electronic Attachment.

4.0 GROUNDWATER ELEVATION DATA EVALUATION

Depth to water measurements were converted to groundwater elevations to develop potentiometric surface maps for the GLF area. **Table 2** presents groundwater elevations. **Figure 3** and **Figure 4** illustrate groundwater conditions in the shallow and intermediate zones, respectively. Tidal impacts close to the shoreline could influence interpreted groundwater flow direction. Vertical survey data are referenced to the North American Vertical Datum of 1988.

Figure 3 shows groundwater levels measured in the shallow zone monitoring wells which ranged from 1.09 feet above mean sea level (AMSL) at TS-01 (-7) to 12.58 feet AMSL at GL-10 (-1). Shallow groundwater elevations are lower on the north side and along the western portion of Greys Landfill, adjacent to the shoreline. Shallow groundwater is inferred to be flowing towards the north and west.

Groundwater elevations for intermediate wells are shown in **Figure 4**. The highest groundwater elevation in the intermediate zone was measured at GL-09 (-20) at 5.50 feet AMSL. This elevation is considered an anomaly when compared to other intermediate wells, which generally have deeper groundwater elevations. Between Spring 2011 and Spring 2026, the groundwater elevation of GL-09 (-20) has ranged from 4.67 to 8.47 feet AMSL (with the exception of the Fall 2018 elevation of 10.19 feet AMSL). Historical groundwater elevations of GL-09 (-20) can be seen in **Appendix E**. Excluding GL-09 (-20), groundwater elevations in intermediate wells ranged from 0.65 feet AMSL in GL-15 (-36) to 1.32 feet AMSL in GL-03R (-16). Because of this relatively small groundwater elevation range, only elevation values and no contours are presented in **Figure 4**.

5.0 MONITORING EVENT AND STATISTICAL TREND ANALYSIS

Groundwater analytical data have been tabulated and evaluated with respect to applicable Project Action Limits (PALs) as per the Quality Assurance Project Plan (Revision 4 dated May 31, 2022). An interpretive discussion of the findings is provided in the following subsections. Historical results have been evaluated for statistically significant trends over time.

Groundwater samples were collected from 17 shallow monitoring wells and 14 of the 15 intermediate monitoring wells. Intermediate monitoring well GL-05 (-25) is damaged and was not sampled.

5.1 GROUNDWATER QUALITY EVALUATION

5.1.1 VOCs

The first half 2026 and historical VOC results for GLF monitoring wells are presented in **Appendix A.** VOC PAL exceedances from the first half 2026 monitoring event are shown in **Figure 5** (shallow zone) and **Figure 6** (intermediate zone). Refer to **Table 3** for a summary of VOCs detected in groundwater.

In the first half 2026, benzene was detected above its PAL (5 µg/L) at four of the 17 shallow monitoring wells. The maximum benzene concentration of 4,400 µg/L at GL-17 (-1) is located along the northern GLF perimeter. Groundwater in the shallow zone near GL-17 (-1) flows to the northwest. Based on the distribution of shallow concentrations (**Figure 5),** VOC impact attenuates significantly with distance from the landfill in the downgradient direction. There is a significant decrease in benzene concentrations from well GL-17 (-1) (4,400 µg/L) to downgradient wells GL-02 (-5) (0.37 J µg/L) and TS-01 (-7) (2.8 µg/L). Refer to **Figure 7** for historic benzene concentrations in GL-17 (-1). The only other shallow VOC detection above its PAL was 1,1-dichloroethane (PAL of 2.7 µg/L) in GL-02 (-5) (21 µg/L), and GL-20 (-5) (3.5 µg/L).

There were no VOC PAL exceedances in intermediate zone monitoring wells.

5.1.2 SVOCs

First half 2026 and historical SVOC results for GLF are presented in **Appendix B**. SVOCs were not listed in Table I or Table II in MDE's December 3, 2012, letter of analytical requirements; however, monitoring wells were analyzed for SVOCs based on recommendations from a previous groundwater compliance report for GLF published in 2011. SVOC results from the first half 2026 monitoring event for GLF are displayed in **Figure 5** (shallow zone) and **Figure 6** (intermediate zone). Refer to **Table 3** for a summary of SVOCs detected in groundwater.

In shallow groundwater, six different SVOCs (1,1-biphenyl, benz[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, dibenz[a,h]anthracene, and naphthalene) were detected above their respective PALs. Naphthalene was the most widespread constituent, exceeding its PAL (0.12 µg/L) in six shallow monitoring wells. Naphthalene PAL exceedances in the first half 2026 ranged from 0.49 µg/L in TS-01 (-7) to 650 µg/L in GL-08 (-3). Naphthalene concentrations for GL-08 (-3) have fluctuated but show a general decreasing trend over the past several years (**Figure 8**). Benz[a]anthracene exceeded its PAL (0.03 µg/L) in five shallow monitoring wells ranging from 0.04 J µg/L (GL-19) to 0.66 µg/L (GL-18R (-3)). Dibenz[a,h]anthracene exceeded its PAL (0.025 µg/L) in two wells: GL-16 (-6) (0.04 J µg/L) and GL-18R (-3) (0.07 µg/L). The remaining SVOC exceedances (1,1-biphenyl, benzo[b]fluoranthene, and benzo[a]pyrene) exceeded their respective PALs in one monitoring well each.

In the intermediate zone, naphthalene exceeded its PAL (0.12 µg/L) in one monitoring well, with a concentration of 0.20 µg/L (GL-18R (-33)). Benz[a]anthracene equaled or exceeded its PAL (0.03 µg/L) in three intermediate monitoring wells: at GL-11 (-33) (0.03 J µg/L), GL-15 (-36) (0.04 J µg/L), and GL-18R (-33) (0.03 J µg/L). No other SVOC exceedances were observed in intermediate wells.

5.1.3 Inorganics

First half 2026 and historical inorganic results for GLF are presented in **Appendix C**. Inorganic PAL exceedances from the first half 2026 event are limited to metals as displayed on **Figure 9** (shallow zone) and **Figure 10** (intermediate zone). Iron, cobalt, and manganese PAL exceedances are considered related to slag fill utilized historically throughout Sparrows Point. Other inorganic compounds (arsenic, beryllium, and cadmium) also exceeded their respective PALs in the shallow and/or intermediate groundwater zones. Refer to **Table 4** for a summary of inorganic constituents detected in groundwater.

Figure 9 shows six inorganics (arsenic, beryllium, cadmium, cobalt, iron, and manganese) exceeded their respective PALs in the shallow groundwater zone. GL-16 (-6) exhibited the most inorganic exceedances with four. Cobalt was the most widespread inorganic constituent in shallow wells, with PAL (6 µg/L) exceedances in five out of 17 shallow monitoring wells. Cobalt exceedances ranged from 39.06 µg/L (GL-11 (-1)) to 252.7 µg/L (GL-16 (-6)). Manganese was detected above its PAL (430 µg/L) in four shallow wells at concentrations ranging from 451.4 µg/L (GL-12 (-3)) to 2,104 µg/L (GL-10 (-1)). Iron was also detected above its PAL (14,000 µg/L) in three shallow wells, with concentrations ranging from 15,200 µg/L (GL-16 (-6)) to 68,100 µg/L (GL-10 (-1)). The remaining inorganic exceedances (arsenic, beryllium, and cadmium) exceeded their respective PALs in three or less monitoring wells. There were no other PAL exceedances in shallow monitoring wells. Historical groundwater concentrations of cobalt, iron, and manganese in three shallow wells ((GL-05 (-7), GL-12 (-3), and GL-16 (-6)) are presented in **Figures 11**, **12**, and **13** with the associated PALs.

As shown on **Figure 10**, three inorganics (cobalt, iron, and manganese) exceeded PALs in the intermediate groundwater zone. Manganese was the most prevalent inorganic detected above its PAL (430 µg/L) in 10 of 14 intermediate groundwater wells. Manganese exceedances ranged from 443.2 µg/L (GL-15 (-36)) to 22,920 µg/L (GL-03R (-16)). Iron was detected above its PAL (14,000 µg/L) in nine intermediate wells. Iron exceedances ranged from 18,500 µg/L (GL-14 (-33)) to 447,000 µg/L (GL-03R (-16)). Cobalt was detected above its PAL (6 µg/L) in five intermediate wells, ranging from 7.277 µg/L (GL-09 (-20)) to 59.72 µg/L (GL-03R (-16)). No other inorganic PAL exceedances were observed in the intermediate wells.

5.2 Statistical Evaluation – Trend Analysis

The Mann-Kendall trend analysis was completed to evaluate the data trends over time for any parameter exceeding its PAL from the first half 2026 sampling event.

The Mann-Kendall test is a non-parametric test for identifying linear trends in data and is suitable for non-normally distributed data and not limited by sample size. The test pairs measurements and assigns a score to each possible pair based on comparing the average of the pair in question to the average of a pair of earlier measurements. If the average of a particular pair of measurements is lower than the average of an earlier pair, it is assigned a score of -1; if it is tied it, is assigned a score of 0; and if it is higher, it is assigned a score of 1. The sum of these scores is computed to obtain the Mann-Kendall Statistic (S). If S is positive, it implies an upward trend over time; if it is negative, it implies a downward trend over time; and an S value near zero roughly indicates there is no apparent data trend. The larger the absolute value of S, the stronger the evidence for an increasing or decreasing trend. For larger data sets (greater than 10), the behavior of S tends to approximate a normal distribution in accordance with the central limit theorem, and a standardized statistic, Z, is used for trend identification. For higher levels of significance, the larger the absolute value of Z or S needs to be to conclude the presence of a trend in data over time. A significance level of 95 percent was used for all Mann-Kendall Tests performed for this evaluation. Data points that were below the detection limits were replaced with half the laboratory reporting limit.

Statistical analyses were performed using the ChemStat® statistical analysis software (version 6.3.0.2, Starpoint Software, Inc., ©1996-2013). The ChemStat® input and output files are included as an Electronic Attachment. When using the Mann-Kendall test, ChemStat® identifies trends as either increasing trends, decreasing trends, or no trend (which does not indicate a stable trend, but rather the absence of a statistically significant increasing or decreasing trend).

5.2.1 Statistical Trends

For GLF constituents exceeding the PAL during the first half 2026 event, statistically significant trends are shown on **Table 5**. If no statistically significant trend was identified for a parameter that exceeded its PAL, it is not shown in **Table 5**. Each trend analysis utilized parameter data for all

sampling events over the historical record. Some GLF well data extend back to 2009. Trend test results are summarized below.

In shallow zone wells there were six constituents (that exceeded their PAL) with statistically significant upward trends: two VOCs (1,1-dichloroethane and benzene), one SVOC (naphthalene), and two inorganic parameters (beryllium and manganese). These upward trends were spread across six shallow zone wells. Two upward trends were identified in GL-16 (-6): beryllium and manganese. Upward trends were also identified for 1,1-dichloroethane in GL-02 (-5); naphthalene in GL-09 (-2) and GL-20 (-5); and manganese in GL-10 (-1) and GL-12 (-3).

In shallow zone wells there were six constituents (that exceeded their PAL) with statistically significant downward trends: one VOC (benzene), three SVOCs (benz[a]anthracene, dibenz[a,h]anthracene, and naphthalene), and two inorganic (arsenic and cobalt). These downward trends were observed in ten shallow monitoring wells. Monitoring wells with the highest number of downward trends observed were GL-17 (-1) (arsenic, benz[a]anthracene, and benzene) and GL-18R (-3) (dibenz[a,h]anthracene, benzene, and naphthalene). Downward trends were also identified for cobalt in GL-05 (-7) and GL-11 (-1); benzene in GL-08 (-3); naphthalene in GL-15 (-6) and TS-01 (-7); dibenz[a,h]anthracene in GL-16 (-6); and benz[a]anthracene in GL-19 and GL-20 (-5).

In intermediate zone wells, there were three constituents (that exceeded their PAL) with statistically significant upward trends: cobalt, iron, and manganese. These upward trends were observed in five intermediate wells. Upward trends were identified for three constituents in GL-03R (-16): cobalt, iron, and manganese. Well GL-08 (-36) had upward trends in two parameters: cobalt and iron. The remaining wells had one parameter with an upward trend: iron in GL-02 (-29); and manganese in GL-10 (-31) and GL-14 (-33).

In intermediate zone wells, there were five constituents (that exceeded their PAL) with statistically significant downward trends: two SVOCs (benz[a]anthracene and naphthalene) and three inorganic parameters (cobalt, iron and manganese). These downward trends were spread across five intermediate wells. Five downward trends were identified in GL-18R (-33) (benz[a]anthracene, cobalt, iron, manganese, and naphthalene). Downward trends were identified for two constituents in GL-12 (-17): iron and manganese. Downward trends were also identified for manganese in GL-08 (-36) and GL-09 (-20) and naphthalene in GL-15 (-36).

For shallow and intermediate zone wells along the shoreline of Bear Creek, there were no statistically significant increasing trends identified for benzene and naphthalene. Upward trends were identified for 1,1-dichloroethane in GL-02 (-5); iron in GL-02 (-29); and beryllium and manganese in monitoring well GL-16 (-6). The detected concentrations are within the historical range for each monitoring well.

5.3 NAPL OBSERVATIONS

On May 4, 2026, a trace amount of NAPL was identified in monitoring well GL-20 (-5). MDE was notified regarding the NAPL observation by phone and email on May 6, 2026. Follow-on weekly NAPL gauging and absorbent sock change-outs were completed for one month. Trace NAPL and minimal recovery was observed in GL-20 (-5) over the one-month period. A summary of NAPL observations in GL-20 (-5) since detection in May 2026 is provided in **Table 6**.

The MDE approved (by email on June 17, 2026) reducing the GL-20 (-5) NAPL observation frequency to monthly and installing absorbent socks only if a measurable NAPL thickness is observed.

6.0 RECOMMENDATIONS

Based on the results for GLF, VOCs detected in shallow groundwater are related to the historical operations in the area (including landfill operations, localized filling, and A11 related activities), while the metal impacts in the intermediate groundwater are likely associated with the slag fill material initially placed in the area.

From the first half 2026 groundwater sampling, the maximum benzene concentration in the shallow groundwater zone was identified in well GL-17 (-1), while the maximum naphthalene concentration was identified in well GL-08 (-3). Both wells are located along the northeast boundary of the landfill. Benzene in GL-08 (-3) had a statistically significant decreasing trend. Benzene and naphthalene detections in shoreline monitoring wells were significantly lower than concentrations further upgradient and are comparable to the values detected in Fall 2025. In addition, there were no increasing trends identified for benzene and naphthalene for the shallow and intermediate monitoring wells along the shoreline, with downward trends for naphthalene observed in the one shoreline well with naphthalene PAL exceedances (TS-01 (-7)).

The existing groundwater monitoring wells are adequately located to monitor impacts to both shallow and intermediate groundwater zones around the landfill. Semi-annual groundwater monitoring events will continue to assess changes in groundwater quality in the area of the GLF. Trends will continue to be evaluated in future sampling events. Groundwater results and trend analysis of the existing monitoring well network will be included in the Second Half 2026 Groundwater Monitoring Report.

Monitoring well was abandoned due to site development.
Monitoring well installed in March 2024; surveyed in October 2025.

Values in red indicate a detection exceedance of the Project Action Limit (PAL)

J: The positive result reported for this analyte is a quantitative estimate.
U: This analyte was not detected in the sample. The numeric value represents the sample quantitation/detection limit.
NS: Not Sampled.
B: The analyte was detected above the reporting limit in the associated method blank.
Wells GL-15 (-6), GL-15 (-36), GL-16 (-6), and GL-16 (-32) displayed naphthalene concentrations less than or equal to the associated method blank (0.23), thus the concentrations are not flagged as exceedances.

Table 3
Summary of Organics Detected in Groundwater
1st Half 2026 – All monitoring wells
Greys Landfill

Parameter	Units	PAL	GL-11 (-33) 5/8/2026 Intermediate	GL-12 (-17) 5/7/2026 Intermediate	GL-12 (-3) 5/7/2026 Shallow	GL-13 (+1) 5/7/2026 Shallow	GL-13 (-26) 5/7/2026 Intermediate	GL-14 (+1) 5/7/2026 Shallow	GL-14 (-33) 5/7/2026 Intermediate	GL-15 (-36) 5/6/2026 Intermediate	GL-15 (-6) 5/6/2026 Shallow	GL-16 (-32) 5/6/2026 Intermediate	GL-16 (-6) 5/6/2026 Shallow

Values in red indicate a detection exceedance of the Project Action Limit (PAL)

J: The positive result reported for this analyte is a quantitative estimate.
U: This analyte was not detected in the sample. The numeric value represents the sample quantitation/detection limit.
NS: Not Sampled.
B: The analyte was detected above the reporting limit in the associated method blank.
Wells GL-15 (-6), GL-15 (-36), GL-16 (-6), and GL-16 (-32) displayed naphthalene concentrations less than or equal to the associated method blank (0.23), thus the concentrations are not flagged as exceedances.

Values in red indicate a detection exceedance of the Project Action Limit (PAL)

J: The positive result reported for this analyte is a quantitative estimate.
U: This analyte was not detected in the sample. The numeric value represents the sample quantitation/detection limit.
NS: Not Sampled.
B: The analyte was detected above the reporting limit in the associated method blank.
Wells GL-15 (-6), GL-15 (-36), GL-16 (-6), and GL-16 (-32) displayed naphthalene concentrations less than or equal to the associated method blank (0.23), thus the concentrations are not flagged as exceedances.

Bold indicates detection
Values in red indicate a detection exceedance of the Project Action Limit (PAL)
J: The positive result reported for this analyte is a quantitative estimate.
U: This analyte was not detected in the sample. The numeric value represents the sample quantitation/detection limit.

Table 5
Greys Landfill
Statistically Significant Trend Summary

Zone	Well ID	Parameter Name	Statistical Trend
Shallow	GL-02 (-5)	1,1-Dichloroethane	Upward
	GL-05 (-7)	Cobalt	Downward
	GL-08 (-3)	Benzene	Downward
	GL-09 (-2)	Naphthalene	Upward
	GL-10 (-1)	Manganese	Upward
	GL-11 (-1)	Cobalt	Downward
	GL-12 (-3)	Manganese	Upward
	GL-15 (-6)	Naphthalene	Downward
	GL-16 (-6)	Beryllium	Upward
		Dibenz[a,h]anthracene	Downward
		Manganese	Upward
	GL-17 (-1)	Arsenic	Downward
		Benz[a]anthracene	Downward
		Benzene	Downward
	GL-18R (-3)	Benzene	Downward
		Dibenz[a,h]anthracene	Downward
		Naphthalene	Downward
	GL-19	Benz[a]anthracene	Downward
	GL-20 (-5)	Benz[a]anthracene	Downward
		Naphthalene	Upward
	TS-01 (-7)	Naphthalene	Downward
Intermediate	GL-02 (-29)	Iron	Upward
	GL-03R (-16)	Cobalt	Upward
		Iron	Upward
		Manganese	Upward
	GL-08 (-36)	Cobalt	Upward
		Iron	Upward
		Manganese	Downward
	GL-09 (-20)	Manganese	Downward
	GL-10 (-31)	Manganese	Upward
	GL-12 (-17)	Iron	Downward
		Manganese	Downward
	GL-14 (-33)	Manganese	Upward
	GL-18R (-33)	Benz[a]anthracene	Downward
		Cobalt	Downward
		Iron	Downward
		Manganese	Downward
		Naphthalene	Downward

Note: All parameters exceeding their project action limit during this sampling event underwent trend testing. If the result of the testing was that no upward or downward trend was identified for a parameter at a particular well, it was not included in this table.

Table 6 - Greys Landfill
NAPL Gauging Activities

Sample ID	Date	Depth to NAPL (Feet TOC)	Depth to Water (Feet TOC)	NAPL Thickness (Feet)	Comment
GL-20 (-5)	12/10/2002	--	--	--	Well installed to 22 feet bgs. Screen from 10-22 ft bgs, blank and riser 12 ft long.
GL-20 (-5)	5/6/2026	Trace	15.18	Trace	Absorbent sock deployed.
GL-20 (-5)	5/18/2026	Trace	15.23	Trace	Absorbent sock removed and replaced (1.5-inch x 18-inch). Trace NAPL on sock.
GL-20 (-5)	5/26/2026	Trace	14.71	Trace	Absorbent sock removed and replaced (1.5-inch x 18-inch). Trace NAPL on sock.
GL-20 (-5)	6/1/2026	Trace	14.52	Trace	Absorbent sock removed and replaced (1.5-inch x 18-inch). Trace NAPL on sock.
GL-20 (-5)	6/9/2026	--	14.66	--	Absorbent sock removed and replaced (1.5-inch x 18-inch). Trace NAPL on sock.
GL-20 (-5)	6/17/2026	--	14.85	--	Absorbent sock removed and replaced (1.5-inch x 18-inch). Trace NAPL on sock.

SHADED = NAPL Detection

bgs = below ground surface

TOC = Top of Casing

*During the 07/2026 NAPL check, absorbent sock will be removed to see if measurable thickness of NAPL accumulates over the following month.

Data Qualifiers Index

Data Qualifier	Definition
1c	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
2c	The read back of the low concentration calibration standard for this compound is not within 30% of the true value. The results may be biased high and should be considered estimated.
3c	The read back of the low concentration calibration standard for this compound is not within 30% of the true value. The results may be biased low and should be considered estimated.
4c	Sample volume was reduced so the sample could be within an acceptable range
5c	The read back of the low concentration calibration standard for this compound is not within 30% of the true value. The results may be biased low and should be considered estimated.
B	Analyte was detected in the associated method blank.
c2	Acid preservation may not be appropriate for the analysis of 2-Chloroethylvinyl ether.
CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
D4	Sample was diluted due to the presence of high levels of target analytes.
E	Analyte concentration exceeded the calibration range. The reported result is estimated.
ED	Due to the extract's physical characteristics, the analysis was performed at dilution.
H3	Sample was received or analysis requested beyond the recognized method holding time.
H6	Analysis initiated outside of the 15 minute EPA required holding time.
IH	This analyte exceeded secondary source verification criteria high for the initial calibration. The reported results should be considered an estimated value.
IL	This analyte exceeded secondary source verification criteria low for the initial calibration. The reported results should be considered an estimated value.
L1	Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
M5	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
M6	Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.
P6	Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.
R1	RPD value was outside control limits.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.
