Mann/Kendall Trend Analysis Data	8

1.0 Introduction

This Monitoring Well Sampling Report has been prepared to satisfy the requirements set forth by the Maryland Department of the Environment (MDE) for the Winfield BP located at 1631 West Liberty Rd. Sykesville, MD; referred to herein as the “site”.

2.0 Groundwater Monitoring

Groundwater monitoring activities for the second quarter (Q2) of 2021 included the gauging and sampling of the complete monitoring well network and the sampling of the domestic supply water well.

2.1 Monitoring Well Gauging & Sampling

On 06/14/21, AEC personnel arrived on site to gauge and sample site monitoring wells (MWs).

Prior to sampling, each well was gauged for presence/absence of LPH as well as depth to groundwater with an electronic oil/water interface meter. LPH was not detected in any of the site wells. After gauging, each well was purged a total of three well volumes of water. Purged groundwater was treated with activated carbon prior to being discharged to the ground. After purging, groundwater was allowed to recover to a minimum of 90% pre purge levels prior to sample collection. Groundwater samples were collected using pre-packaged, single use, disposable bailers and placed in laboratory supplied VOA's and then placed in a cooler with ice and chain of custody record for delivery to the laboratory.

All groundwater samples were delivered on ice with a chain of custody record, trip blank and temperature blank to AECs laboratory to be analyzed by EPA Method 8260 for volatile organic compounds (VOCs).

2.2 Domestic Supply Well Sampling

On 06/14/21, AEC personnel collected quarterly samples from the supply well servicing the store.

The domestic supply wells servicing the adjacent properties; 1709 West Liberty Rd and 1621 West Liberty Rd were sampled in Q4 of 2019.

All samples were collected by an MDE certified drinking water sampler and placed in a cooler with ice, chain of custody record, trip blank and temperature blank for delivery to AECs laboratory to be analyzed by EPA Method 524 for volatile organic compounds (VOCs).

3.0 Results of Groundwater Sampling

3.1 Groundwater Elevation & Flow Direction

Relative groundwater elevation, calculated using depth to groundwater measurements collected from the shallow monitoring wells during the 06/14/21 sampling event, ranged from 58.43feet in MW-2 (highest) to 54.46 feet in MW-4 (lowest). Based on the survey data and the depth to groundwater measurements collected, the groundwater elevation contours for the shallow wells depict groundwater flow to be primarily to the west.

Relative groundwater elevation, calculated using depth to groundwater measurements collected from the deep monitoring wells during the 06/14/21 sampling event, ranged from 58.60 feet in MW-6D (highest) to 54.66 feet in MW-9D (lowest). Groundwater elevation contours for the deep wells depict groundwater flow to be to the west.

3.2 Monitoring Well Sampling Results

Method detectable concentrations of VOCs were observed in the groundwater samples collected on 06/14/21 from the sites monitoring well network.

MTBE was identified in Site MWs

- MW-1 (1.49ug/l)
- MW-4 (21.1ug/L)
- MW-5S(70.9ug/L)
- MW-7D(1.51ug/L)
- MW-8D(298ug/L)

TPH GRO was identified in Site MWs

- MW-5S(78ug/L)
- MW-8D(330ug/L)

A Quick Reference Historical Groundwater Sampling Summary Table which summarizes current and historical groundwater sampling analytical results can be found in Appendix B.

A full Report of Analysis and Chain of Custody Record can be found in Appendix C.

3.2.1 Concentration Statistical Trend Evaluation

Mann/Kendall data analysis using the GSI Mann-Kendall Toolkit was performed on MWs-exhibiting detectable concentrations Including MW-4, MW-5S, MW-7D, MW-8D. The Trend analysis indicated that there was a declining trend of MTBE contamination for all MWs for the data analysis was performed.

Mann/Kendall analysis trend analysis could not be performed for Benzene, Toluene, Ethylbenzene or Xylenes, due to insufficient detectable concentrations.

The Mann Kendall Analysis using the GSI Mann-Kendall Toolkit is provided in Appendix D.

3.3 Domestic Supply Well Sampling Results

3.3.1 Site Well

Method detectable concentrations of VOCs were observed in the drinking water sample collected from the site's drinking water well (4.71ug/L MTBE) during the Q2 of 2021 sampling event.

Method detectable concentrations of VOCs were not observed in the drinking water samples collected from the adjacent properties drinking water wells located at 1709 West Liberty Road (Little George's) and 1621 West Liberty Rd (PNC Bank) during the November of 2019 sampling event.

A table summarizing the results of the recent sampling as well as all historical sampling can be found in Appendix B.

4.0 Future Activities and Request for MW Abandonment and Reduction of Analytical Parameters

AEC, Inc., on behalf of Tevis Oil Inc., would like to request that MDE allow for the abandonment of MWs; MW-9d, MW-5d, MW-7d, MW-6d and MW-1. AEC is also requesting that MDE reduce the analytical requirements for the remaining MWs (MW-2, MW-3, MW4, MW-5s, MW-8d and PW-1). AEC is requesting that the analysis requirement for the remaining wells be limited to VOCs by EPA 8260 plus oxygenates thereby removing the TPH DRO and GRO by EPA 8015 analysis requirement.

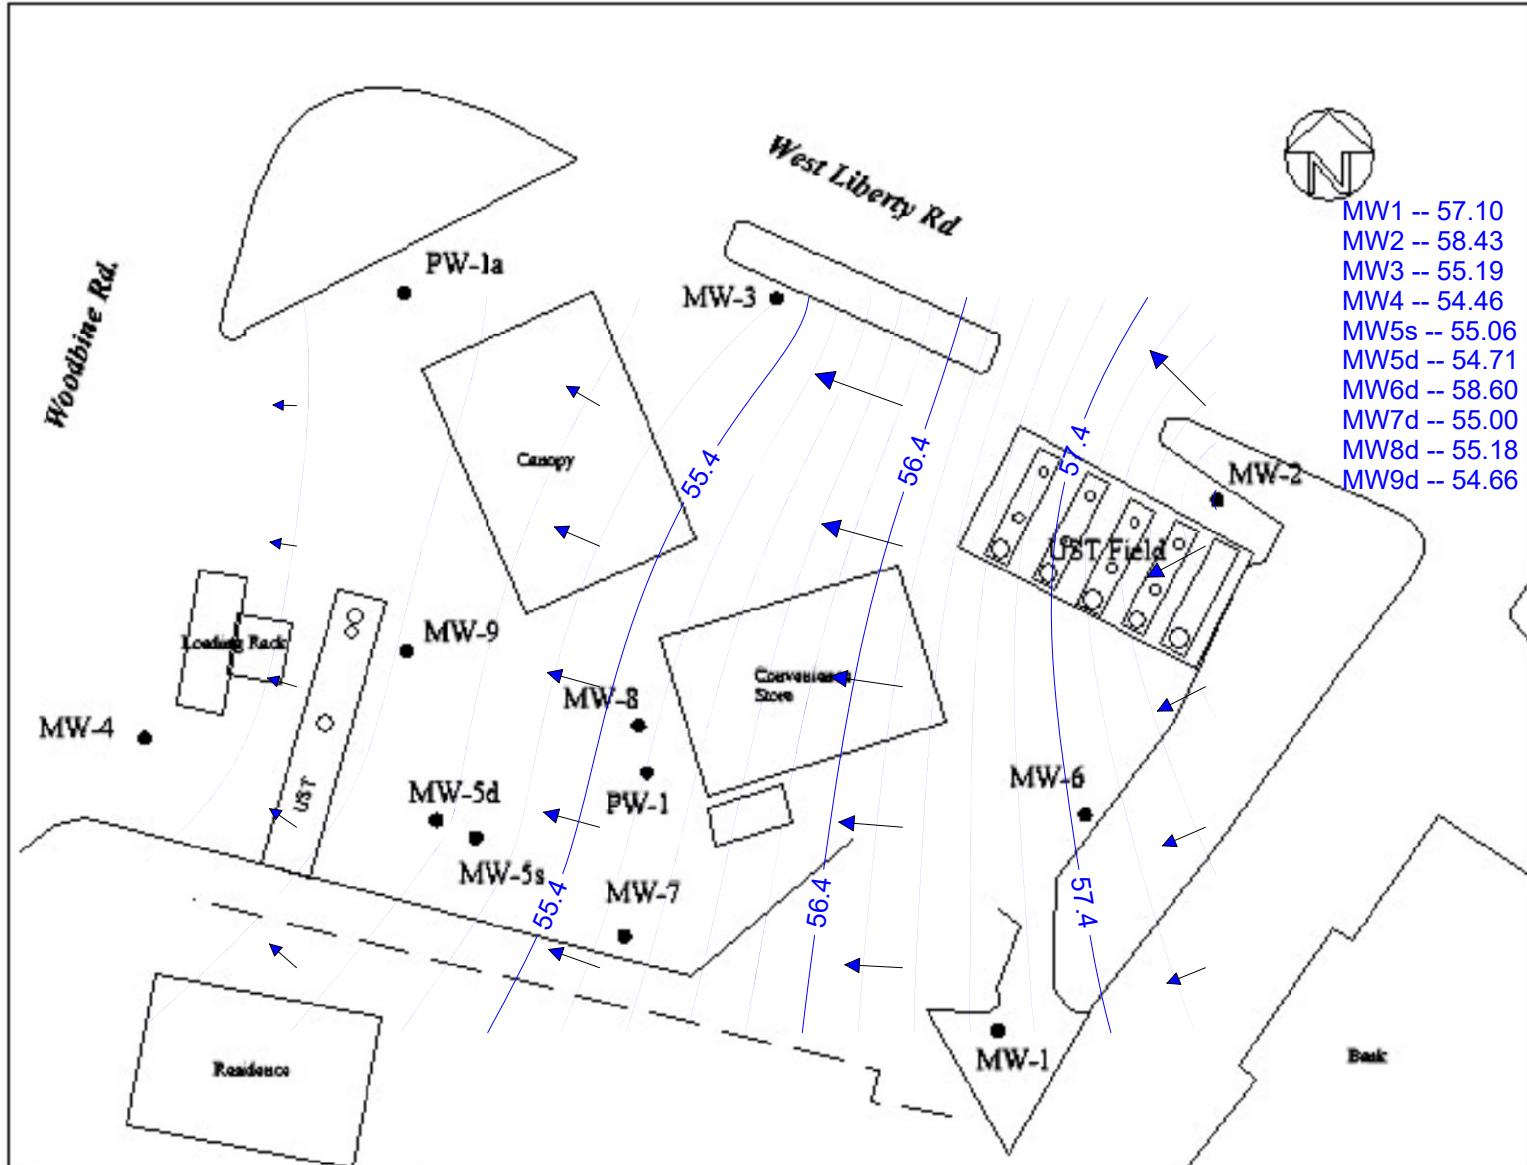

This request for MW abandonment is based on;

- The below actionable limits or nondetectable concentrations of compounds observed in the samples collected from the MWs proposed for abandonment. Analytical tables documenting the concentrations for the wells are provided in Appendix B.
- Mann-Kendall Statistical Analysis indicates that all MWs showing contamination have a decreasing seasonal trend. (Mann Kendall Trend Analysis is provide in Appendix D)

AEC is requesting the diminished analytical requirements because the contamination detected is primarily the oxygenate MTBE and all contaminants have been established to fall within the gasoline range of total petroleum hydrocarbons. Therefore, the analysis for TPH DRO and GRO offers limited scientific benefit.
