**Re: Monitoring Well Installation and Downhole Geophysical Summary Report**  
**Bel Air Xtra Fuels No. 7805**  
**2476 East Churchville Road, Bel Air, Maryland**  
**MDE Case #2011-0112-HA and 2013-0007-HA**  
**Facility I.D. No. 12391**

Dear Ms. Bull:

Groundwater & Environmental Services, Inc. (GES), on behalf of Drake Petroleum Company, Inc. (Drake), has prepared the attached Monitoring Well Installation and Downhole Geophysical Summary Report for the Department's review and comment. The report summarizes field observations, screening measurements and analytical data obtained during the installation of monitoring wells MW-21 S, MW-21 I and MW-21 D from October 7 to October 17, 2019. The report also summarizes downhole geophysical testing performed on the MW-21 I and MW-21 D boreholes which occurred November 17 and 18, 2019.

GES appreciates the continued guidance of the MDE on this project. If you have any questions or require additional information, please contact the undersigned at (800) 220-3606 extension 3703.

Sincerely,

**GROUNDWATER & ENVIRONMENTAL SERVICES, INC.**

## 1. INTRODUCTION

Global Partners LP (Global) contracted Groundwater & Environmental Services, Inc. (GES) to assess subsurface conditions associated with the former Bel Air Xtra Fuels station located at 2476 East Churchville Road in Bel Air, Maryland (Site). A Horizontal and Vertical Delineation Work Plan was submitted to the Maryland Department of the Environment (MDE) on April 19, 2019 and was approved with minor changes on July 25, 2019. The work was performed to further delineate and characterize the horizontal and vertical extent of soil and groundwater impacts at an area downgradient of the Site, within the Campus Hills Shopping Center, and in proximity to the current La Tolteca restaurant located at 2350 East Churchville Road.

The scope of work included the installation of three separate, but proximal, monitoring wells screened within shallow, intermediate and deep water-bearing zones. A separate “cluster” well configuration, as opposed to a single, multi-level “nested” well configuration, was selected for the new well series to ensure adequate isolation of the targeted water-bearing zones thereby reducing the likelihood of borehole communication between these zones.

During initial well installation activities, which occurred from October 7 to 17, 2019, discrete soil samples were collected, screened, and logged from each of the three boreholes. The final construction of shallow well MW-21 S was completed at this time. After the completion of intermediate (MW-21 I) and deep (MW-21 D) boreholes, but prior to final well construction, downhole geophysical characterization was performed for the intermediate and deep boreholes on October 17 and 18, 2019. GES provided a summary correspondence of geophysical results and proposed final well construction specifications for MW-21 I and MW-21 D to the MDE on November 4, 2019. MDE responded with approval of the proposed well specifications on November 21, 2019. Wells MW-21 I and MW-21 D were final constructed, developed and then surveyed into the existing well network on December 11 and 12, 2019. Groundwater samples were collected from wells MW-21 S, MW-21 I and MW-21 D, along with the other 14 wells comprising the network, during the fourth quarter 2019 monitoring event on December 20 and 23, 2019. (Well MW-7R had to be resampled on January 9, 2020 due to a lab error.) Soil and groundwater generated from the recent monitoring well installation activities were transported for treatment and disposal, to authorized waste handling facilities, on December 12 and 18, 2019, respectively.

A Site Location Map is included as **Figure 1**, a Local Area Map is included as **Figure 2**, and a Site Map is included as **Figure 3**. A Photo Log, chronicling well installation and downhole geophysical testing activities, is included in **Appendix A**.

## 2. OBJECTIVES

The objectives of the recent monitoring well installation and site investigation, was to delineate and characterize the horizontal and vertical extent of soil and groundwater impacts at a location between the upgradient former Xtra Mart service station and downgradient potable supply wells located across Churchville Road, which includes the 1 Meadow Spring Drive residence.

The results of the site investigation will be used to assess the current state of remediation efforts at the Site and to determine the extent of dissolved groundwater impacts in the downgradient portion of the Site study area.

### 3. SITE DESCRIPTION

#### 3.1 Location and Description

The Site is located at 2476 Churchville Road in Bel Air, Harford County, Maryland. The Site is a former Xtra Fuels fuel station, currently vacant and is located within the Campus Hills Shopping Center. The Campus Hills Shopping Center borders the property boundaries of the Site to the north, west and east. To the immediate south of the Site lies the East Churchville Road corridor. Toward the western terminus of the shopping center property, approaching the intersection of Campus Hills Drive and East Churchville Road, lies the La Tolteca restaurant, which is in proximity to an area of parking lot selected for the installation of the MW-21 well cluster. Across East Churchville Road, downgradient and to the southwest of the MW-21 well area, are residences and a church served by potable water supply wells.

The Site area is illustrated in the Site Location Map attached as **Figure 1**. A localized view of the Site and surrounding features is presented in the Local Area Map, attached as **Figure 2**. A Site Map, which includes the position of the Site in relation to the downgradient locations of the three recently installed monitoring wells, is attached as **Figure 3**.

#### 3.2 Geology and Hydrogeology

The Site lies in the eastern portion of Maryland's Piedmont Physiographic Province. According to the Maryland Geologic Survey (1968), the Site is underlain by the Port Deposit Gneiss, “*a moderately to strongly deformed intrusive complex composed of gneissic biotite quartz diorite, hornblende-biotite quartz diorite, and biotite granodiorite; all rocks foliated and some strongly sheared; age 550 +/- 50 million years by radiogenic dating.*”

Regional topography is relatively flat however, the Site and the surrounding shopping center lot gently slope to the northeast away from East Churchville Road. The closest surface water body is an unnamed stream located approximately 750 feet to the northwest that feeds into a pond located approximately one-half mile north of the Site.

### 4. SITE ASSESSMENT ACTIVITIES

#### 4.1 Monitoring Well Installation

From October 7 to October 17, 2019, GES observed SGS, a Maryland-licensed drilling firm, conduct borehole and monitoring well installation work near the La Tolteca restaurant area of the Campus Hills Shopping Center. The monitoring wells were placed as a shallow, intermediate and deep interval “cluster” set per the approved work plan. The locations of the recently completed monitoring wells MW-21 S, MW-21 I and MW-21 D are included on the Site Map as **Figure 3**.

A private utility markout of the planned investigation area was completed by GES subcontractor Blood Hound on September 23, 2019. A public utility markout (MISS Utility #19670732) was requested by SGS on September 26, 2019.

On the initial day of drilling (October 7, 2019) all three locations were "soft dug" using air knife and vacuum extraction techniques, prior to advancing any downhole drilling equipment. Each location was successfully cleared for utilities to five feet (ft) below ground surface (bgs).

Throughout borehole completion and monitoring well installation activities, soils and cuttings were screened with a photoionization detector (PID) which measures the composite vapor concentration of volatile organic compounds (VOCs) emanating from the media. At the beginning of each day, the PID was calibrated with a 100 parts-per-million (ppm) isobutylene gas standard and a fresh air standard (0.0 ppm). Sample depth intervals, lithologic characteristics, and PID readings recorded during drilling activities for MW-21 S, MW-21 I and MW-21 D are presented in corresponding Soil Boring Logs included as **Appendix B**. Pictures of drilling and investigation activities have been compiled to a Photo Log and are presented as **Appendix A**.

#### 4.1.1 Monitoring Well MW-21 S

Installation and soil sampling of shallow well MW-21-S was completed with a hollow stem auger and sampled with a 2-ft split-spoon. Soil samples were collected, screened and logged continuously from 5 ft bgs to a spoon-refusal depth of 22.75 feet bgs.

In summary, logging records for the MW-21 S soils describe a predominately silty sand saprolite with little to trace parent rock fragments, which indicates a highly weathered, saprolitic overburden zone to at least 22.75 ft bgs. Peak PID values obtained during the screening of MW-21 S occurred at a depth of 21.5 feet bgs, with a measurement of 1.4 ppm.

One soil sample was collected from the MW-21 S boring (21.0-21.75 ft bgs) and was analyzed for a full suite of VOCs via United States Environmental Protection Agency (USEPA) Method 8260B, Total Petroleum Hydrocarbons - Diesel Range Organics (TPH-DRO) via USEPA Method 8015B and Total Petroleum Hydrocarbons - Gasoline Range Organics (TPH-GRO) via USEPA Method 8015B. Upon collection, soils were placed into glass jars, packed on ice and submitted to Eurofins Lancaster Laboratory (Lancaster) of Lancaster, PA. Laboratory analytical results from the MW-21 S soil sample and chain-of-custody documentation are presented in **Appendix C**.

Monitoring well MW-21 S was final-constructed as a 2-inch diameter PVC well with a .010-slot, screen interval set from 10 to 30 ft bgs within an 8-inch borehole. A #1 sand pack was placed in the well annulus from 8 to 30 feet bgs. A #0 choker sand was placed in the annulus from 7 to 8 ft bgs. A layer of hydrated bentonite was placed 6 to 8 ft bgs and the remaining well annulus was grouted to grade with a cement/bentonite slurry from 0.5 to 6 ft bgs. The MW-21 S monitoring well was capped with a locking gripper plug and was finished at grade with a 2 x 2 ft concrete pad and a steel flush-mount manhole cover assembly.

#### 4.1.2 Monitoring Well MW-21 I

Installation of intermediate well MW-21 I was accomplished via air rotary and downhole hammer drilling methods. Grab samples of drill cuttings were collected, logged and screened approximately every 10 to 15 feet to a depth of 40 ft bgs and then approximately every 5 to 10 feet from 40 to 80 feet bgs. Soil samples from MW-21 I were not submitted for laboratory analysis.

Observation of soil cuttings at 30 ft bgs indicated that weathered rock fragments were more prominent in the cutting matrix, suggesting a transition from a saprolitic overburden into a weathered bedrock zone. At 70 ft bgs, cuttings became predominately rock fragments (with reduced sand/silt) suggesting a transition from a weathered bedrock to a competent bedrock zone. At the 79 to 80 ft bgs interval, the driller noted a fracture feature and a noticeable increase in water production. A PID screening of cuttings from the 80 ft bgs interval reached a value of 1.8 ppm, which was the highest PID measurement for this boring. GES confirmed with the MDE, while onsite, that the MW-21 I bore be extend to a total depth of 85 ft bgs to accommodate the observed fracture zone at 79 to 80 ft bgs.

On October 9, 2019, a 40-ft length of 6-inch diameter steel casing was installed into the 10-inch MW-21 I borehole with a grouted annulus from ~0.25 to 40 ft bgs. On October 10, 2019 an open borehole was completed below the 6-inch steel casing, from 40 to 85 ft bgs with a 6-inch air hammer.

Final construction of MW-21 I occurred on December 12, 2019 after downhole geophysical characterization had been completed. It was determined that the original MW-21 I borehole interval from 80 to 85 ft bgs was obstructed. This obstruction was suspected to have resulted from cave-in and/or from grout migration related to the installation of nearby well MW-21 D.

Construction for MW-21 I consisted of 2-inch, .010-slot well screen from 65 to 80 ft bgs with solid PVC riser from near-grade to 65 feet bgs. A #1 sand was placed in the borehole annulus from 63 to 80 ft bgs with #0 choker sand from 62 to 63 ft bgs. A cement/ bentonite grout slurry was pumped via a tremie-pipe from 0.5 to 62 ft bgs. The completed MW-21 I monitoring well was capped with a locking gripper plug and was finished at grade with a 2 x 2 ft concrete pad and a steel flush-mount manhole cover assembly.

#### 4.1.3 Monitoring Well MW-21 D

Installation of deep well MW-21-D was accomplished via air rotary and downhole hammer drilling methods. Grab samples of drill cuttings were collected, logged and screened approximately every 5 to 10 feet.

On October 10, 2019, a 40-ft length, 10-inch diameter steel casing was installed into the 14-inch borehole of MW-21 D with a grouted annulus from ~0.25 to 40 ft bgs.

On October 11, 2019, the MW-21 D borehole was extended below the 10-inch steel casing, from 40 ft bgs to 83 ft bgs, using a 10-inch roller bit. During this stage, the driller noted potential water producing fractures at 66 and 70 ft bgs and a significantly productive fracture at 80 ft bgs. Drilling was temporally postponed at 83 ft bgs due to excessive water production, which was captured and stored in onsite drums.

Drilling from 83 ft bgs at MW-21 D resumed on October 14, 2019, after GES had arranged for a vacuum truck to support water containment. During advancement of the 10-inch open borehole, a PID reading of 391.8 ppm was recorded for cuttings collected at 90 ft bgs but had reduced to 0.0 ppm for cuttings produced by 100 feet bgs. It was considered that this elevated PID measurement reflected the concentration of groundwater in fractured, competent rock closer to 80 feet but was logged as a 90 feet sample due to cutting return lag to the surface. By the end of October 14, 2019, a 100-ft length, 6-inch steel casing was installed through the 10-inch casing and into the 10-inch underlying borehole, with a grouted annulus from ~0.25 to 100 ft bgs.

On October 15, 2019, the MW-21 D open borehole was completed below the 6-inch steel casing from 100 to 200 ft bgs, using a 6-inch hammer drill bit. The borehole was noticeable “dry” with no significant fracture features or water production (per the driller) until depth of approximately 180 ft bgs, where a yield of <1 gpm was estimated based on fluid return. PID response for the 100 to 200 ft bgs interval was generally 0.0 ppm with a 0.1 ppm value measured at 170 ft bgs and a peak value of 0.2 ppm measured at 180 ft bgs.

Final construction of MW-21 D occurred on December 12, 2019 and consisted of 2-inch, .010-slot well screen from 180 to 200 ft bgs, with solid PVC riser from near-grade to 180 ft bgs. A #1 sand was placed in the borehole annulus from 177 to 200 ft bgs with #0 choker sand from 176 to 177 ft bgs. A cement/bentonite grout slurry was pumped via a tremie-pipe from 0.5 to 176 ft bgs. The completed MW-21 D monitoring well was capped with a locking gripper plug and was finished at grade with a 2 x 2 ft concrete pad and a steel flush-mount manhole cover assembly.

On December 12, 2019, the three new MW-21 cluster wells were surveyed into the exiting monitoring well network.

On December 13, 2019, wells MW-21 S, MW-21 I and MW-21 D were developed using a submersible pump until the water was clear of fines and sediment. Development water was captured in properly labelled 55-gallon steel drums and then staged at the Site for pending transport and disposal.

## 4.2 Groundwater Sampling

On December 20 and 23, 2019, groundwater gauging and sampling activities were completed as part of routine fourth quarter 2019 monitoring event. Groundwater gauging measurements were collected from all active monitoring wells using an oil/water interface probe.

Initial depth to water measurements for new wells MW-21 S, MW-21 I and MW-21 D, gauged December 20, 2019, were 13.43 ft, 14.05 ft and 175.45 ft from top-of-casing, respectively. It was evident, at this time, that well MW-21 D had not fully recharged from well development activities which had occurred on December 13, 2019. The groundwater sample collected from well MW-21 D was performed as a grab. All other wells sampled for the event were first purged three volumes and then sampled upon sufficient recharge.

During fourth quarter 2019 monitoring event, groundwater samples were collected from each well using dedicated disposal bailers and placed in laboratory provided bottleware. All samples were shipped on ice, under chain-of-custody, to SGS Accutest Laboratories of Dayton, New Jersey.

Groundwater samples were submitted for a full suite VOC analysis, plus naphthalene, via EPA Method 8260 and TPH-GRO and TPH-DRO analyses via EPA Method 8015. Groundwater analytical results are summarized in **Table 2** with the laboratory analytical report and chain-of-custody documentation included as **Appendix C**. A more thorough presentation of the December 2019 monitoring event will be provided in the Site Status Report – Fourth Quarter 2019, which will be submitted as separate correspondence.

#### 4.3 Waste Disposal

On December 12, 2020, 42 drums of soil cuttings, generated during the installation of the MW-21 cluster wells, were removed from the Site. The soil drums were loaded and transported by ACV Enviro, an authorized waste-handling contractor, to the approved Soil Safe treatment facility located in Brandywine, Maryland. A copy of the soil disposal manifest is presented in **Appendix D**.

On December 18, 2019, 17 drums of groundwater generated during recent well installation and development activities were removed from the Site. The groundwater drums were loaded and transported to the approved Reco Biotechnology treatment facility located in Richmond, Virginia. A copy of the groundwater disposal manifest is presented in **Appendix D**.

### 5. SUMMARY OF RESULTS

#### 5.1 Soil Analytical Results

A summary of analytical results obtained from the MW-21 S soil sample, which was collected from the interval of peak PID response (21.0 to 21.75 ft bgs), is included as **Table 1**. Review of MW-21 S analytical results demonstrates detections of benzene, methyl tert-butyl ether (MTBE), tert-butyl alcohol (TBA) and tert-Amyl methyl ether (TAME) at 0.63 J, 117, 205 and 2.9 micrograms per kilogram ( $\mu\text{g}/\text{kg}$ ), respectively. These detections are well below MDE soil cleanup standards for the respective constituents. The laboratory analytical report and chain-of-custody document for the MW-21 S soil sample is included as **Appendix C**.

#### 5.2 Groundwater Analytical Results

A historical summary of analytical results, including results obtained from MW-21 S, MW-21 I and MW-21 D sampled during the fourth quarter 2019 monitoring event, are presented in **Table 2**. Review of **Table 2** indicates the following:

- Benzene exceeded the MDE Groundwater Cleanup Standard for Type I and II Aquifers of 5 micrograms per liter ( $\mu\text{g}/\text{L}$ ), at MW-21 S and MW-21 D, with concentrations of 9.9 and 14.8  $\mu\text{g}/\text{L}$ , respectively.
- MTBE exceeded the MDE Groundwater Cleanup Standard for Type I and II Aquifers of 20  $\mu\text{g}/\text{L}$ , at MW-21 S, MW-21 I and MW-21 D, with concentrations of 1,790, 3,040 and 1,540  $\mu\text{g}/\text{L}$ , respectively.

- TPH-GRO exceeded the MDE Groundwater Cleanup Standard for Type I and II Aquifers of 47 µg/L, at MW-21 S, MW-21 I and MW-21 D, with concentrations of 116, 143 and 166 µg/L, respectively.
- TPH-DRO exceeded the MDE Groundwater Cleanup Standard for Type I and II Aquifers of 47 µg/L, at MW-21 S, MW-21 I and MW-21 D, with concentrations of 2,060, 3,180 and 1,650 µg/L, respectively.

The laboratory analytical report and chain-of-custody documentation for the fourth quarter 2019 monitoring event are included as **Appendix C**. A map of the groundwater analytical results and interpreted direction of groundwater flow, as determined from the fourth quarter 2019 monitoring event, is included as **Figure 4**.

## 6. DOWNHOLE GEOPHYSICAL CHARACTERIZATION

### 6.1 Purpose

As stated in the April 19, 2019 Horizontal and Vertical Delineation Work Plan, the purpose of downhole geophysical activities was to identify and characterize potential fractures and water bearing features within the intermediate and deep aquifer zones at the Site. Observations and results obtained during the downhole geophysical testing were used to support the determination of final construction specifications, including appropriate PVC-constructed screen intervals, for the corresponding intermediate and deep monitoring wells MW-21 I and MW-21 D.

### 6.2 Methodology

Downhole geophysical characterization of the MW-21-I and MW-21-D boreholes was completed from November 17 to 18, 2019 and was performed by GES subcontractor, Earth Data Northeast (EDN).

During the event, a suite of geophysical tools were successively deployed in each of the two boreholes. These tools logged characteristics included fluid temperature, fluid conductivity, borehole width (via caliper), gamma, spontaneous potential, resistance and resistivity (via the “e-log”) and fracture aperture and orientation (via the acoustic tele-viewer).

Based on a field-review of downhole data, zones-of-interest were identified for each borehole. The zones-of-interest were then individually tested for fracture flow, using the heat pulse tool, performed under both ambient (static) and dynamic (pumped) conditions. Typically, three flow measurements were collected at each zone during the heat pulse evaluation. The identified zones-of-interest and corresponding average flow values obtained from each borehole, during heat pulse testing, are presented in a table on the next page.

For reference, the heat pulse tool has range of sensitivity from approximately 0.03 to 1.0 gallons-per-minute (gpm). A positive value indicates the flow is moving “up-borehole” (from the tool) and a negative value indicates flow is “down-borehole”. The submersible pump for both dynamic heat pulse tests performed at MW-21 I and MW-21 D were set 10 feet (ft) above bottom of casing (i.e.

30 ft below grade surface (bgs) for MW-21 I and 90 ft bgs for MW-21 D). Pump rates for dynamic tests conducted at both wells were maintained at 0.5 gpm. Heat pulse results for each zone-of-interest are summarized in the table below and also appear in the EDN geophysical logs for MW-21 I and MW-21 D attached as **Appendix E**.

**Table 3 –Summary of Heat Pulse Flow Values**

Borehole	Zone-of-Interest (ft bgs)	Average Ambient Flow (gpm)	Average Dynamic Flow (gpm)
MW-21 I	56	-0.030	+0.092
	65	No Flow	+0.030
	73	No Flow	No Flow
	79.5	+0.030	No Flow
MW-21 D	108	+0.031	+0.094
	122	+0.020	+0.019
	143	+0.018	No Flow
	166	+0.030	0.023
	185	+0.025	+0.025
	198	+0.028	No Flow

### 6.3 Observations and Analysis

Review of field notes collected during the downhole geophysical testing, in conjunction with analysis of the EDN downhole geophysical logs (**Appendix E**) and heat pulse data (**Table 3**), support the following observations:

- The predominate direction of strike for fracture features mapped in both the MW-21 I and MW-21 D boreholes were oriented northeast-southwest with a moderate to highly inclined dip to the northwest.
- Variance of borehole diameter and large fracture apertures apparent in the MW-21 I geophysical log suggest an interval of highly weathered bedrock. A more consistent borehole diameter and reduction of fracture apertures noted in the MW-21 D geophysical log support a competent bedrock interval for this borehole.
- The fracture flow rates measured at various zones-of-interest during the ambient heat pulse tests at MW-21 I and MW-21 D are considered nominal and exist at the lower threshold of the tool's sensitivity. In addition, flow rates obtained during dynamic heat pulse tests conducted at intervals in proximity the pump intake appeared to demonstrate higher flow values (and direction) and are therefore considered bias.
- Drawdown achieved during dynamic heat pulse testing was more significant at MW-21 D (~3.32 ft in 37 minutes.) in comparison to drawdown observed during dynamic tests of MW-21 I (~0.8 ft in 32 minutes). Therefore, the MW-21 I borehole (open from 40 ft bgs to 80 ft bgs) appeared more productive than the MW-21 D borehole (open from 100 ft bgs to 200 ft bgs), at the time of geophysical testing.

- During dynamic heat pulse testing at MW-21 I, a solvent-like odor from the dynamic test purge water was noted. The odor was present but reduced from purge generated during the dynamic testing at MW-21 D.

## 7. SUMMARY AND CONCLUSION

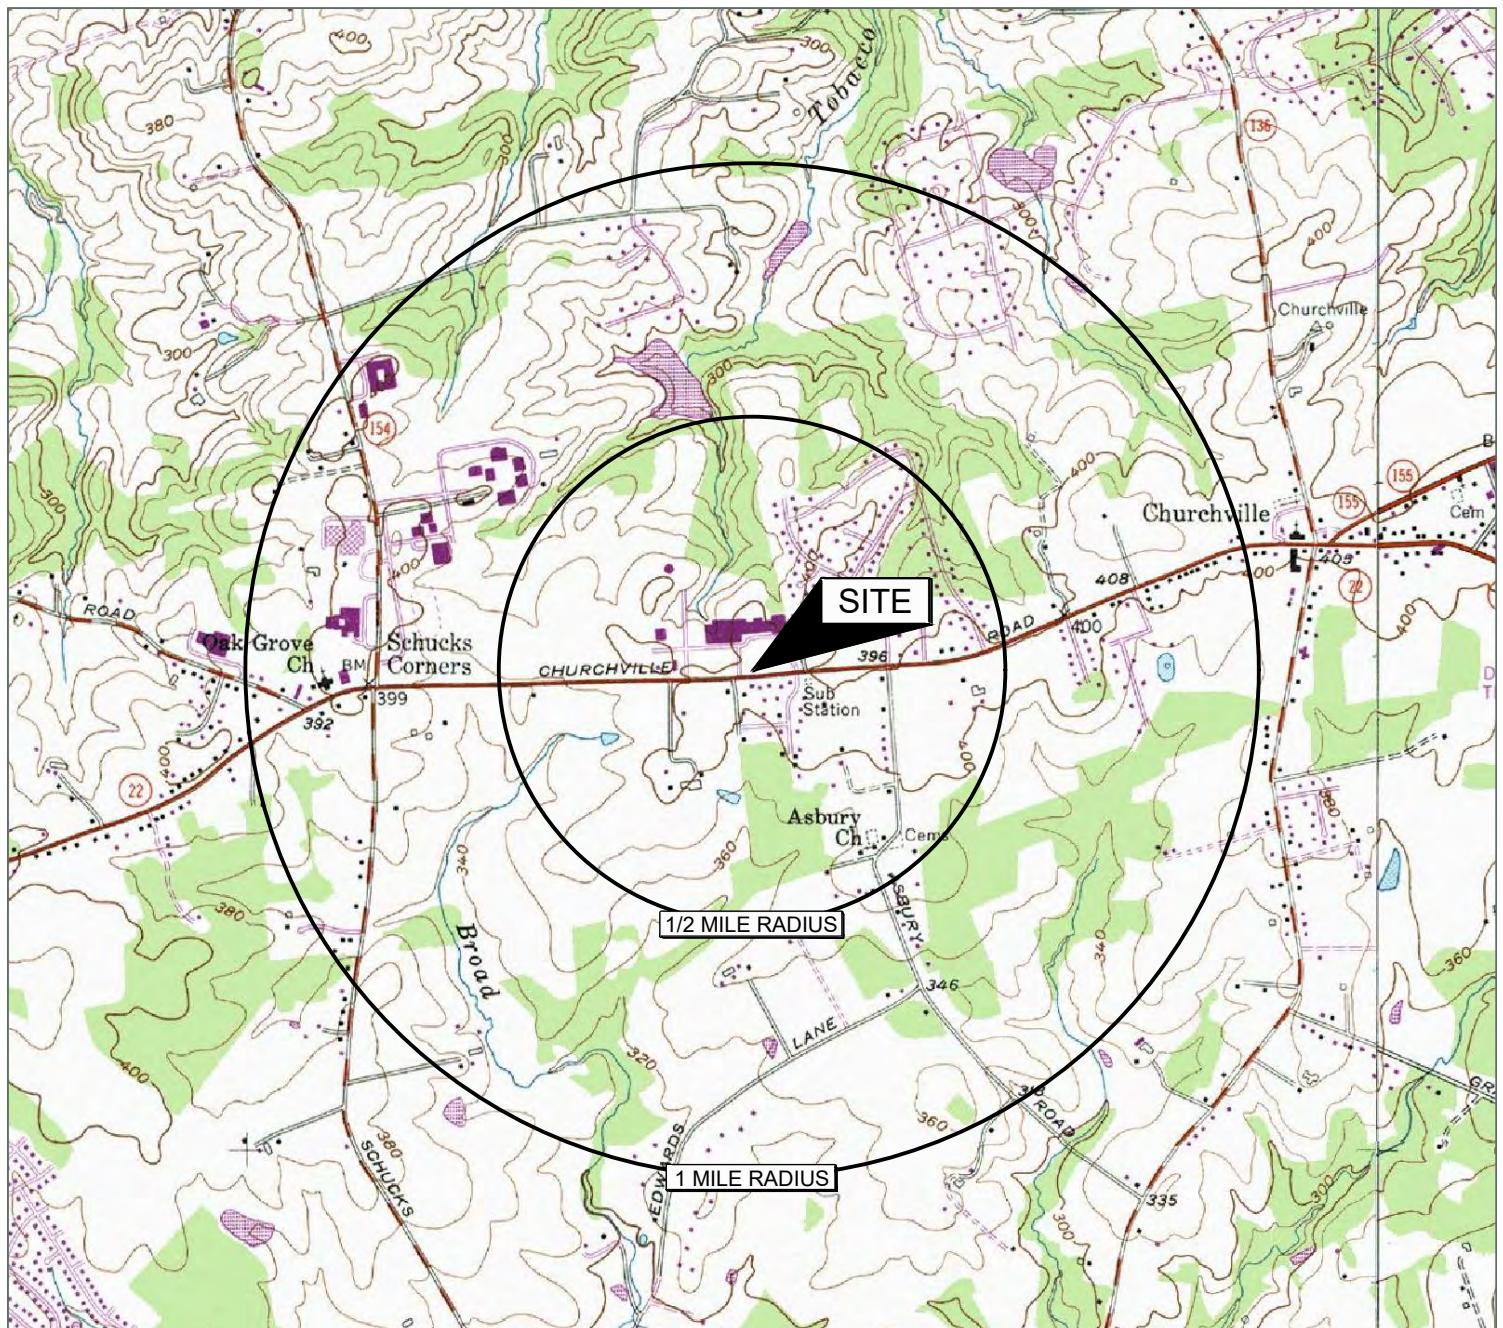

GES recently completed installation of three “cluster” wells (MW-21 S, MW-21 I and MW-21 D) within the Campus Hills Shopping Center, positioned downgradient of the former Xtra Mart service station location, and in proximity to the current La Tolteca restaurant. The MW-21 well cluster is positioned upgradient of potable supply well locations located to the southwest and across Churchville Road., which includes the 1 Meadow Spring Drive residence. The work was performed to further delineate and characterize the horizontal and vertical extent of soil and groundwater impacts at an area downgradient of the Site

Analytical results from soil and groundwater samples collected during recent well installation and the fourth quarter 2019 monitoring activities indicated that detections of benzene and MTBE exist at shallow ( $\geq 30$  ft bgs), intermediate (65 to 80 ft bgs) and deep groundwater intervals (180 to 200 ft bgs) in the MW-21 cluster well area. The groundwater sample for MW-21D was collected as a grab sample as the well had not fully recharged from initial well development activities conducted a week prior. Therefore, the groundwater analytical results for MW-21 D may be biased due to the low volume of water available at the time of sampling.

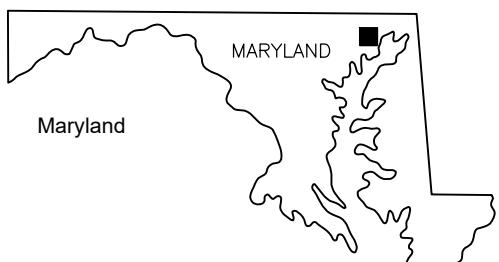

The three new MW-21 cluster wells are now included with the current quarterly monitoring and reporting program for the case. GES, on behalf of Global, will continue to monitor and assess groundwater quality in the downgradient area of the Site, unless otherwise directed by the MDE.

## Tables

---

**Table 1****Soil Analytical Data Summary**

**Former Bel Air Xtra Fuels  
2476 Churchville Road  
Bel Air, Maryland**

Sample Location	Date	PID Reading (ppm)	Depth (fbg)	Benzene (mg/kg)	tert-butyl alcohol (mg/kg)	MTBE (mg/kg)	t-amyl methyl ether (mg/kg)	TPH-GRO (mg/kg)
MDE Residential Soil Clean-Up Standards				1.2	-	47	-	230
MDE Non-Residential Soil Clean-Up Standards				5.1	-	210	-	620
MW-21S	10/08/19	1.4	21-21.75	0.00063	.205	0.117	0.0029	<5.3

**Notes:**

PID = Photoionization detector

ppm = parts per million

mg/kg = Milligram per kilogram

&lt;# = Non-Detect, the reporting limit is given

fbg = Feet below grade

MTBE = methyl tertiary butyl ether

TPH-DRO = Total Petroleum Hydrocarbons - Diesel Range Organics

- = no standard available

Clean up standards based on October 2018 MDE Interim Final Guidance Document

Only laboratory detected constituents are included in the Soil Data Summary.

Removed in December 2016 when USTs were removed												

All samples were placed on ice in a cooler and transported under a Chain of Custody to Accutest Laboratories of Dayton, NJ. All samples were analyzed within the applicable holding time with a dilution of 10% Hydrochloric Acid (HCL) as a preservative. All samples were sampled using a disposable bailer & were purged three volumes, prior to sampling. Regulatory Standards are based on the Maryland Department of the Environment Maryland Environmental Assessment Technology Generic Number Standards (February 2003).

GW Cleanup Standards are the Maryland Department of the Environment (MDE) Groundwater Clean-Up Standards for Type I and II Aquifers. Standards were taken from the MDE Cleanup Standards for Soil and Groundwater, June 2008.

- BTEX = Benzene, toluene, ethylbenzene, xylenes
- J = Estimated Concentration
- MTBE = Methyl-tertiary Butyl-ether
- NA = Not Available or not analyzed for that specific compound
- ND = Not detected above laboratory method detection limits
- NR = Not reported
- NS = Not sampled
- TPH-DRO = Total Petroleum Hydrocarbons - Diesel Range Organics
- TPH-GRO = Total Petroleum Hydrocarbons - Gasoline Range Organics
- \* or DRY = Insufficient water to collect a groundwater sample for analysis

460-00-4	4-Bromofluorobenzene	100%		80-120%

- (a) Associated CCV outside of control limits high, sample was ND. This compound in BS is outside in house QC limits bias high.
- (b) Associated CCV outside of control limits low.
- (c) This compound in BS is outside in house QC limits bias high.

ND = Not detected      MDL = Method Detection Limit  
 RL = Reporting Limit  
 E = Indicates value exceeds calibration range

J = Indicates an estimated value  
 B = Indicates analyte found in associated method blank  
 N = Indicates presumptive evidence of a compound

# SGS Sample Receipt Summary

Job Number: JD902 Client: GROUNDWATER & ENVIRONMENTAL S Project: DRAKE BEL AIR  
 Date / Time Received: 12/24/2019 3:20:00 PM Delivery Method: Airbill #'s:

Cooler Temps (Raw Measured) °C: Cooler 1: (2.8); Cooler 2: (3.4);

Cooler Temps (Corrected) °C: Cooler 1: (2.6); Cooler 2: (3.2);

<b>Cooler Security</b>	<b>Y or N</b>	<b>Y or N</b>	<b>Sample Integrity - Documentation</b>	<b>Y or N</b>
1. Custody Seals Present:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	1. Sample labels present on bottles:	<input checked="" type="checkbox"/>
2. Custody Seals Intact:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	2. Container labeling complete:	<input checked="" type="checkbox"/>
			3. Sample container label / COC agree:	<input checked="" type="checkbox"/>
<b>Cooler Temperature</b>		<b>Y or N</b>	<b>Sample Integrity - Condition</b>	<b>Y or N</b>
1. Temp criteria achieved:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	1. Sample recvd within HT:	<input checked="" type="checkbox"/>
2. Cooler temp verification:	IR Gun		2. All containers accounted for:	<input checked="" type="checkbox"/>
3. Cooler media:	Ice (Bag)		3. Condition of sample:	Intact
4. No. Coolers:	2			
<b>Quality Control Preservation</b>		<b>Y or N</b>	<b>Sample Integrity - Instructions</b>	<b>Y or N</b>
1. Trip Blank present / cooler:	<input type="checkbox"/>	<input checked="" type="checkbox"/>	1. Analysis requested is clear:	<input checked="" type="checkbox"/>
2. Trip Blank listed on COC:	<input type="checkbox"/>	<input checked="" type="checkbox"/>	2. Bottles received for unspecified tests	<input type="checkbox"/>
3. Samples preserved properly:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	3. Sufficient volume recvd for analysis:	<input checked="" type="checkbox"/>
4. VOCs headspace free:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	4. Compositing instructions clear:	<input type="checkbox"/>
			5. Filtering instructions clear:	<input type="checkbox"/>
				<input checked="" type="checkbox"/>
