1.0 INTRODUCTION

1.1 Historical Background

The Amcelle Rubble Fill (Permit no. 1999-WRF-0206) located in Allegany County, Maryland, is an inactive construction-and-demolition waste disposal site that received a permit for the former Amcelle Mill demolition debris (Figure 1). The site started receiving rubble fill on 2 June 1994 and received an interim closure in 1997. Final capping of the rubble fill occurred on October 1, 2010, and the mandatory 5 year post closure care period began upon final approval by the Maryland Department of the Environment (MDE) on July 11, 2015.

As of 23 July 2001, the landfill property was deeded by Allegany County to the Maryland Department of Public Safety and Correctional Services.

1.2 Reporting Requirements

The groundwater quality at the landfill is monitored semi-annually through 8 groundwater monitoring wells that are screened in the water-table aquifer. The permit requires semi-annual sampling and the submission of a statistical report that discusses groundwater quality from all of the monitoring wells specified in the groundwater monitoring plan. The report is to include analytical data (Appendix A), a Quality Assurance/Quality Control report (Appendix B), statistical analysis of the sampling results (Table 3), a groundwater contour map depicting the groundwater elevation, gradient, and flow direction (Figure 2), time-series analysis of historic data (Figure 3), and geochemical diagrams (Figures 4 and 5).

In the event that statistical analysis reveals a statistically significant increase of any Appendix I constituent, the Maryland Department of the Environment (MDE) is to be notified within 14 days of the determination. Allegany County will then consult with the MDE in preparing an assessment monitoring plan.

In a letter dated January 2, 2024, MDE updated the monitoring and reporting requirements for Tables I and II parameters to include Per- and Polyfluoroalkyl Substances (PFAS). These parameters have been sampled since the 2nd semi-annual 2024 event.

1.3 Work Scope

The purpose of this document is to provide a statistical report of the impact the facility has had to groundwater. A total of 58 sampling events have been collected and a statistical analysis was performed on the geochemistry of the groundwater from the 58 sampling events to determine the impact if any to groundwater from the landfill. Quarterly gas monitoring began March 2001.

2.0 GEOLOGY AND HYDROGEOLOGY

2.1 Introduction

The landfill is situated approximately 4 miles southwest of Cumberland, MD in the Potomac River floodplain between Haystack and Knobley mountains, adjacent to the border of Maryland and West Virginia (Figure 1). The landfill rests on the southeast side of the Haystack and Wills Mountain anticline with strata dipping to the southeast. Stratigraphy in the area of the landfill is dominated by Silurian-aged sedimentary rocks consisting of shale, sandstones, and limestones. The Rose Hill Formation, the McKenzie Formation, and the Wills Creek Shale have gradational contacts and all crop out in the area. The McKenzie Formation is the unit that most likely underlies the landfill. Additionally, thin river floodplain deposits are present at the site.

2.2 Local Hydrogeology

The local hydrogeology is dominated by topography, with the groundwater gradient trending southeast towards the north branch of the Potomac River. The unit is recharged by surface infiltration from precipitation, runoff from the surrounding slopes and transmission from adjacent rock strata. The wells range in depth from 20 to 62 feet and are screened within the Silurian strata or floodplain deposits.

Gradient is approximately 0.0119 ft/ft to the east toward the North Branch of the Potomac River.

3.0 GROUNDWATER MONITORING PROGRAM

3.1 Well Network

The water-table aquifer is monitored at the landfill through 8 wells; 1 upgradient (MW-13) and 7 down-gradient (MW-3, MW-4, MW-5, MW-6, MW-7, MW-11, and MW-12). The monitoring wells are screened through the water-table aquifer.

The wells were sampled March 25, 2024 (Tables 1 and 2). Based on available records, these wells have been sampled 58 times.

3.2 Sampling Program

The groundwater monitoring plan for the site includes 40 CFR Part 258, Appendix I metals, volatile organic compounds (VOC's), chlorides, COD, alkalinity, nitrate, pH, specific conductivity, temperature, dissolved oxygen, and common cations and anions (Appendix A). All wells at the site have been equipped with dedicated sampling equipment and are sampled semi-annually. Each well is equipped with low-flow bladder pumps and is sampled after the field parameters stabilize. No difficulties were encountered during this sampling event.

3.3 Quality Assurance/Quality Control

Quality assurance and quality control at Amcelle Rubble Landfill are performed in accordance with the *Post-Closure Detection Monitoring Plan* (R.E. Wright, 1997). The program includes the collection and analysis of trip blanks and duplicate samples (Appendix B). For this event, PFAS analyses were subcontracted to Eurofins Lancaster Laboratories using EPA Method 1633.

The QA/QC package included laboratory control samples, matrix spikes, matrix spike duplicates, laboratory duplicates, and method blanks. All general chemistry and metals QA/QC results were within method acceptance criteria. Minor qualifiers were noted where spike recoveries were outside control limits, but these did not affect the usability of the data.

For PFAS, method blanks were non-detect, confirming no laboratory contamination. Several low-level PFAS detections were reported, including:

- PFOA in MW-1 (2.8 ng/L, J-qualified)
- PFOS in MW-1 (8.2 ng/L) and MW-2 (1.8 ng/L)
- PFHxS in MW-2 (13 ng/L)
- PFBS in MW-3 (0.72 J ng/L)

These detections were below federal health advisory levels but represent measurable concentrations above method reporting limits. Duplicate and isotope dilution recoveries for key PFAS analytes were generally within acceptance limits, supporting the reliability of reported results.

Trip blanks collected during the event did not detect any volatile organic compounds (VOCs). Overall, no significant QA/QC issues were identified that would affect interpretation of the groundwater analytical results.

4.0 STATISTICAL EVALUATION

4.1 Introduction

Subtitle D allows for a variety of statistical techniques for the evaluation of groundwater data (CFR V. 56, No. 196; §258.53). Several different statistical strategies were implemented at Rubble Fill at the request of MDE. The Mann-Kendall Test for Trend was used for intra-well analyses and either the Kruskal-Wallis test or the Wilcoxon Rank-Sum test was used for the inter-well comparisons (Table 3). Time-series (control chart) analyses were performed on every constituent (Table 4; Figures 3).

4.2 Data Evaluations

Two types of statistical comparisons were used to test for trends: an intra-well test for trend and an inter-well comparison where upgradient water quality is compared to downgradient water quality. The statistical procedures used are distribution-free methods, whereby the tests do not assume these data to be normally distributed. This eliminates the concern of reaching a false conclusion from violating assumptions. The Type I error rate, or false positive rate, was set at 0.01 for each test. Concentrations of parameters reported as less than the limit of detection were set equal to half of the detection limit.

4.2.1 Intra-Well Test for Trend

The Mann-Kendall Test for Trend was applied to each constituent in each monitoring well. The Mann-Kendall test is a nonparametric or distribution free test for trend (U.S. Environmental Protection Agency (EPA) guidance document 1992; Gilbert 1987)

Increasing trends can be represented mathematically in several formulas, and the most common is a linear increase expressed as (Gilbert 1987):

$$C_i = \alpha + \beta \times X_i + e_i$$

Where, $\mathbf{C_i}$ represents the concentration at time $\boldsymbol{I}$; α represents the concentration at time 0; β represents the slope coefficient or rate of increase in concentration; $\boldsymbol{X_i}$ represents the sample date; and, $\boldsymbol{e_i}$ represents the random deviations about the line. Random deviations from a continuum can be thought of as variability in concentration in a given monitoring well over a short period of time. If the slope coefficient (β) is not statistically greater than zero, then it is concluded that there is no statistically significant increase in concentration over time (Gilbert, 1987). Hollander and Wolfe (1973) apply the Mann-Kendall test as a distribution-free test for the slope coefficient.

The Mann-Kendall test is designed to identify increasing or decreasing trends in data and is applied to a constituent in a given monitoring well by comparing the current concentration to each prior concentration observed. An indicator variable is assigned a value of 1, 0, or -1, if the current concentration is greater than, equal to or less than, respectively, each prior concentration. The sum of indicator variables (**K**) is then compared to a critical value as a test for trend. The critical statistic is defined to have a 5 percent chance of falsely concluding a trend exists. Large positive values of **K** indicate a positive trend over time; negative values of **K** indicate a negative trend over time.

The test for trend was performed using data collected from the 2nd semi-annual 2024 through the 1st semi-annual event of 2025 and a second trend test was performed using data collected from the 1995 annual event through the 1st semi-annual event of 2025 (Table 3).

4.2.2 Inter-Well Comparison

Inter-well comparisons of constituent concentrations are used to evaluate the difference in downgradient water quality with the upgradient water quality. It is again emphasized, however, that for this analysis, inter-well comparisons are used as a general screening tool since spatial variability is not accounted for (i.e., either one or no upgradient wells per zone). Comparisons were made by using either the Kruskal-Wallis test or the Wilcoxon Rank-Sum test. The Kruskal-Wallis test was used if less than 50 percent of the concentrations of the constituents were reported as less than the limit of detection. The Wilcoxon Rank-Sum test was used if at least 50 percent of the concentrations of the constituent were reported as less than the limit of detection (EPA 1992).

4.2.2.1 Kruskal-Wallis Test - The Kruskal-Wallis test compares a groundwater constituent's median concentration over time. The objective of this test is to determine if the median concentration at a given downgradient location is significantly greater than that upgradient within the same water-bearing zone.

The Kruskal-Wallis test simultaneously evaluates monitoring well constituent data by comparing their median concentrations over time. For a given constituent in a given zone, the initial step of the Kruskal-Wallis test is to replace concentration with its rank. The rank is obtained by jointly ranking all concentrations from lowest to highest, regardless of monitoring well, and a rank of 1 is assigned to the lowest observed concentration, a rank of 2 to the second lowest concentration, and so on. The average rank is used for concentrations that have the same value.

A statistic is then calculated using the sum of the ranks for each monitoring well. If this statistic is less than or equal to the critical value, it is concluded that there is no difference among monitoring wells. The critical value is obtained from the chi-square distribution with appropriate degrees of freedom. If this statistic exceeds the critical value, then it is concluded that a difference between at least two monitoring wells exists. Further investigation is necessary to evaluate if this difference is attributable to differences in downgradient and upgradient concentrations. This is accomplished by statistically comparing each downgradient monitoring well's mean rank to the upgradient mean rank using the procedure presented in EPA (1992).

4.2.2.2 Wilcoxon Rank-Sum Test - EPA (1992) recommends the Wilcoxon Rank-Sum test over its prior recommendation, the Test of Proportions (EPA 1989), because the Wilcoxon Rank-Sum has a better chance of concluding a difference does exists. The Wilcoxon Rank-Sum test compares the median concentration of the two groups (i.e., the upgradient well and the downgradient wells). The Wilcoxon Rank-Sum test is quite similar to the Kruskal-Wallis test except the Kruskal-Wallis test compares the median concentration of more than two groups. The objective of the Wilcoxon Rank-Sum test is to determine if the median concentration of the group of downgradient monitoring wells is significantly greater than that of the upgradient group.

For a given constituent in a given zone, the initial step of the Wilcoxon Rank-Sum test is to replace concentration with its rank. The rank is obtained by jointly ranking all concentrations from lowest to highest, regardless of monitoring group, and assigning a

rank of 1 to the lowest concentration, a rank of 2 to the second lowest concentration, and so on. The average rank is used for concentrations that have the same value.

A statistic is then calculated using the sum of the ranks at the downgradient monitoring well group. If this statistic is less than or equal to the critical value, it is concluded that there is no difference among the downgradient and upgradient groups. The critical value is obtained from the standard normal distribution. If this statistic exceeds the critical value, then verification sampling may be required to determine if the downgradient group is statistically greater than the upgradient group.

4.2.3 Time-Series Evaluation

Time-series or control chart evaluations provide graphic representations of how a dataset varies through time (Figure 3). This allows historical trends to be observed simultaneously for each well.

4.3 Decision Criteria

The results of these statistical tests are used together with other analyses to assess the potential of a leachate release. Decision criteria used in this analysis include:

1) Time-series plots;
2) Comparison of constituents to control limits (i.e., background);
3) Water quality comparisons at upgradient and downgradient wells using trilinear plots, Stiff diagrams, etc.;
4) Source characterization (i.e., leachate results vs. groundwater results) summarized through geochemical plots (i.e., trilinear and/or Stiff diagrams);
5) The natural spatial variability between monitored geologic zones; and,
6) The historical absence of VOCs.

5.0 RESULTS OF STATISTICAL ANALYSES

5.1 Volatile Organic Analyses

No volatile organic compounds (VOCs) were detected above laboratory quantitation limits in any well during the 1st Semi-Annual 2025 sampling event (Table 5; Appendix A). All results were reported as non-detect, and no estimated ('J') values were assigned.

5.2 Metals and Inorganic Statistical Analysis

For the 1st semi-annual event of 2025, no intra-well statistically significant increases (SSIs) were present. No monitoring well showed both intra- and inter-well statistical exceedances for any parameter.

During the 1st Semi-Annual 2025 sampling event, exceedances of National Primary Drinking Water Standards were limited to turbidity, which was reported above the 5 NTU MCL in MW-3 (29 NTU), MW-4 (65 NTU), MW-7 (65 NTU), MW-11 (32 NTU), MW-12 (9.2 NTU), and MW-13 (38 NTU). All other regulated primary constituents were below their respective MCLs, including arsenic (maximum 4.7 µg/L compared to the 10 µg/L MCL), barium (0.146 mg/L compared to 2 mg/L), cadmium (0.004 mg/L at MW-5 compared to 0.005 mg/L), chromium (non-detect compared to 0.1 mg/L), lead (maximum 1.4 µg/L compared to the 15 µg/L action level), mercury (non-detect compared to 2 µg/L), nitrate-nitrogen (maximum 0.93 mg/L compared to 10 mg/L), and thallium (non-detect compared to 2 µg/L). No volatile organic compounds (VOCs) were detected in any well. Aside from turbidity, no exceedances of primary drinking water standards occurred during this sampling event, though exceedances of secondary standards for iron, manganese, sulfate, total dissolved solids, and pH were observed and are addressed separately.

Exceedances of Secondary Maximum Contaminant Levels (SMCLs) were observed for iron, manganese, sulfate, total dissolved solids, and pH. These results are consistent with historical groundwater quality at the site and reflect natural variability and acid mine drainage influence rather than landfill leachate impact.

Typical geochemical analyses of the groundwater show that groundwater is a calcium-bicarbonate type of water, whereas the typical leachate has a strong component of sodium and chloride ions (Figures 4 and 5). The geochemical similarity of the groundwater samples and the dissimilarity of groundwater to typical leachate provide strong evidence that the groundwater at the facility has not been impacted by leachate.

6.0 LANDFILL GAS MONITORING

The Amcelle Rubble Landfill gas monitoring program was established in October 2000 and originally included six borehole locations. The program was modified in 2012 to include four permanent gas monitoring probes (GMP-1 through GMP-4). Soil gas sampling for the 1st and 2nd quarters of 2025 occurred on March 25 and June 17, respectively (Appendix D). Soil gas monitoring includes connecting a quick connect couple to the soil gas probe and measuring the gas extracted from the soil at the depth of the probe.

If an exceedance above the Lower Explosive Limit (LEL) occurs in a gas monitoring probe, then another sample is collected within 7 days.

No LEL exceedances for methane were detected in the soil gas monitoring probes during the 1st or 2nd quarterly events of 2025. Methane was not detected in any probe during either sampling event, and the facility has remained in compliance with the post-closure gas monitoring requirements (Appendix D).

7.0 SUMMARY

A statistical analysis of groundwater monitoring data collected during the 1st Semi-Annual 2025 sampling event at Amcelle Rubble Landfill shows that the landfill has not impacted groundwater.

Past sampling events had shown statistically significant increases in inter-well analyses for total metals. Rehabilitation of the wells and the installation of low-flow pumps reduced the concentrations of total metals, and all wells at the facility now have dedicated low-flow pumps.

This analysis included data collected from 1995 through the 1st Semi-Annual 2025 sampling event. The major conclusions of this report are:

1. Soil gas samples show that methane does not exist in the soils at a reasonable distance from the landfill (<5 feet).

2. No VOCs were detected above drinking water standards.

3. No statistically significant increases exist for both intra- and inter-well analysis for any constituent. No maximum concentration levels (MCLs) for metals and inorganic constituents were exceeded except for turbidity in MW-3, MW-4, MW-7, MW-11, MW-12, and MW-13.

4. In an October 22, 2002 letter to the Maryland Department of the Environment, the Maryland Department of Public Safety and Correctional Services indicated that they plan no further use of the Rubble landfill and that plans to cap the landfill were pending.

5. Although the final cap was completed during October 2010, the post closure monitoring and maintenance period did not officially begin until the Department conducted a final walk through inspection and documented their approval in a letter dated July 11, 2011. The mandatory 5 year period extended through July 2016.

6. In order to determine if a site is prepared to exit the post closure care, the site owner must show the Department that the site does not, and will not have a detrimental impact on the environment and that the site is meeting all regulatory requirements for groundwater quality, landfill gas migration, and cap maintenance.

7. Based on a review of the last 5 years of monitoring data at the site, the Department has indicated that a total cessation of groundwater monitoring at the facility is unlikely to be approved due to occasional very low VOC detections and intra- and interwell SSIs. However, the site has shown little/no evidence of landfill gas migration and visual inspection reports submitted since 2012 have shown that the cap has been maintained in good working order.

7.1 Recommended Actions

1. Submit a revised environmental monitoring plan for Department review now that the mandatory 5 year post closure period is over. This plan may request to modify of cease some portions of the groundwater and landfill gas monitoring plans which have proven to be in compliance for the entire post closure car period.

2. Continue semi-annual sampling as approved by the Department.

ANALYTICAL REPORT

PREPARED FOR

Attn: James R Krents
Geochemical Testing
2005 North Center Avenue
Somerset, Pennsylvania 15501

Generated 4/7/2025 8:16:28 AM

JOB DESCRIPTION

ACM Rubble

JOB NUMBER

410-214131-1

Eurofins Lancaster Laboratories Environment Testing, LLC
2425 New Holland Pike
Lancaster PA 17601

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Authorization

Generated
4/7/2025 8:16:28 AM

Authorized for release by
Dana Kauffman, Project Manager
Dana.Kauffman@et.eurofinsus.com
(717)556-7219

Compliance Statement

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Table of Contents

Definitions/Glossary

Client: Geochemical Testing
Project/Site: ACM Rubble

Job ID: 410-214131-1

Qualifiers

LCMS

Qualifier	Qualifier Description
cn	Refer to Case Narrative for further detail
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
410-214131-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/27/2025 9:30 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.3°C.

Receipt Exceptions
Limited sample volume was received. Less than 25ml in the one container and 50 ml in the other container G2503D42-001 (410-214131-1).

All backup containers for water samples received for 1633 PFAS analysis were frozen after receipt.

PFAS
Method 1633_Final: Analyte Perfluorononanoic acid (PFNA) was marked as non-detect for sample G2503D42-003 (410-214131-3) and G2503D42-004 (410-214131-4) due to a detection below RL and failing ion ratio.

Method 1633_Final: Target analyte(s): Perfluorononanoic acid (PFNA) were detected in the method blank associated with the following samples: G2503D42-001 (410-214131-1), G2503D42-002 (410-214131-2), G2503D42-003 (410-214131-3) and G2503D42-004 (410-214131-4). Since the native analyte is not detected in the sample, the data is reported.

Method 1633_Final: Reporting limits were raised for the following sample: G2503D42-001 (410-214131-1) due to limited sample volume.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

MDE MONITORING PARAMETERS - TABLE I (cont.)

Per- and Polyfluoroalkyl Substances (PFAS)	Units	PQL	MCL	HI MCL[1]	HBWC
Perfluorooctanoic acid (PFOA)	ng/L	2.0	4.0		
Perfluorooctanesulfonic acid (PFOS)	ng/L	2.0	4.0		
Perfluorononanoic acid (PFNA)	ng/L	2.0		1.0 (unitless)	10
Perfluorohexanesulfonic acid (PFHxS)	ng/L	2.0			9.0
Perfluorobutanesulfonic acid (PFBS)	ng/L	2.0			2000
Hexafluoropropylene oxide dimer acid (HFPO-DA, GenX)	ng/L	2.0			10

PQL = Practical Quantitation Limit (Method 1633)
MCL = Maximum Contaminant Level
HI MCL = Hazard Index MCL
HBWC = Health Based Water Concentrations

Note:
1 – A running annual average hazard index value greater than 1.0 is a violation of the HI MCL.
Formula: Hazard Index Value = ((GenX ng/L)/(10 ng/L)) + ((PFBS ng/L)/(2000 ng/L)) + ((PFNA ng/L)/(10 ng/L)) + ((PFHxS ng/L)/(9 ng/L))

JOB DESCRIPTION

ACM Rubble

JOB NUMBER

410-214129-1

Eurofins Lancaster Laboratories Environment Testing, LLC
2425 New Holland Pike
Lancaster PA 17601

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Authorization

Generated
4/11/2025 2:13:03 AM

Authorized for release by
Dana Kauffman, Project Manager
Dana.Kauffman@et.eurofinsus.com
(717)556-7219

Compliance Statement

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Definitions/Glossary

Client: Geochemical Testing
Project/Site: ACM Rubble

Job ID: 410-214129-1

Qualifiers

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 410-214129-1 — Eurofins Lancaster Laboratories Environment

Job Narrative
410-214129-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/27/2025 9:30 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.3°C.

Receipt Exceptions
All backup containers for water samples received for 1633 PFAS analysis were frozen after receipt.

PFAS
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

MDE MONITORING PARAMETERS - TABLE I (cont.)

Per- and Polyfluoroalkyl Substances (PFAS)	Units	PQL	MCL	HI MCL[1]	HBWC
Perfluorooctanoic acid (PFOA)	ng/L	2.0	4.0		
Perfluorooctanesulfonic acid (PFOS)	ng/L	2.0	4.0		
Perfluorononanoic acid (PFNA)	ng/L	2.0		1.0 (unitless)	10
Perfluorohexanesulfonic acid (PFHxS)	ng/L	2.0			9.0
Perfluorobutanesulfonic acid (PFBS)	ng/L	2.0			2000
Hexafluoropropylene oxide dimer acid (HFPO-DA; GenX)	ng/L	2.0			10

PQL = Practical Quantitation Limit (Method 1633)
MCL = Maximum Contaminant Level
HI MCL = Hazard Index MCL
HBWC = Health Based Water Concentrations

Note:
1 – A running annual average hazard index value greater than 1.0 is a violation of the HI MCL.
Formula: Hazard Index Value = (GenX ng/L)/(10 ng/L)) + ((PFBS ng/L) (2000 ng/L)) + ((PFNA ng/L)/(10 ng/L)) + ((PFHxS ng/L)/(9 ng/L))

Question	Answer	Comment
The cooler's custody seal is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature acceptable,where thermal pres is required(</=6C, not frozen).	True	
Cooler Temperature is recorded.	True	
WV:Container Temp acceptable,where thermal pres is required (</=6C, not frozen).	N/A	
WV: Container Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the containers received and the COC.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses.	True	
Is the Field Sampler's name present on COC?	True	
Sample custody seals are intact.	N/A	
VOA sample vials do not have headspace >6mm in diameter (none, if from WV)?	N/A

Analytical QC Summary Report

Explanatory Notes

1. Spike recovery limits are not applicable when the sample concentration exceeds the spike concentration by a factor of four or greater.
2. Matrix Spike and MS Duplicates are sample specific controls and are not used to evaluate the analytical batch.
3. Laboratory duplicate. If one or both of the values is less than 5 times the PQL, the allowed difference is +/- the PQL.
4. "R" indicates a relative percent difference (RPD) was above the acceptance limit between duplicate QC samples or sample specific duplicates.

Table I ON Qualifiers

Qualifier	Description
1	Spike recovery limits are not applicable when the sample concentration exceeds the spike concentration by a factor of four or greater.
B	Analyte detected in the associated method Blank.
B1	Dilution water blank exceeded method criterion.
C1	CCV recovery above the acceptance limits. Results may be biased high.
C2	CCV recovery below the acceptance limits. Results may be biased low.
C3	ICV recovery above the acceptance limits. Results may be biased high.
C4	ICV recovery below the acceptance limits. Results may be biased low.
D1	The analysis did not meet the minimum DO depletion of at least 2 mg/L.
D2	The analysis did not meet the minimum residual DO of at least 1 mg/L.
D3	Sample required dilution due to a matrix interference.
D4	Sample was diluted in the extraction steps due to marked matrix interferences.
D5	Sample required dilution due to a chloride interference.
D6	Sample was diluted and the reporting limits were raised to achieve method compliant internal standard recovery.
D7	Sample was digested at a dilution due to the formation of a post-digestion precipitate.
D8	Sample was digested at a dilution to achieve method compliant matrix spike recovery.
D9	Sample was digested at a dilution to meet method compliant digestion criteria.
E	Value above quantitation range.
E2	Unable to obtain a stable weight within specified limits due to sample matrix. Value is estimated.
F1	Fecal sample tested positive for residual chlorine.
H	Method Hold Time exceeded and is not compliant with 40CFR136 Table II.
H1	Due to under-depletion from the initial dilutions for BOD, the sample was reanalyzed outside the hold time.
H2	Due to over-depletion from the initial dilutions for BOD, the sample was reanalyzed outside the hold time.
H3	Sample was re-analyzed outside of hold time due to error during original analysis.
H4	The Nitrite result used to report Nitrate was analyzed past the 48-hour holding time.
I1	Internal standard recovery above method acceptance limits. Results are estimated.
I2	Internal standard recovery was below method acceptance limits. Results are estimated.
IP	One of the instrument performance checks ( ) did not meet the acceptance criteria.
J	Indicates an estimated value.
L1	LCS above the acceptance limits. Result may be biased high.
L2	LCS below the acceptance limits. Result may be biased low.

L3	Analyte was spiked into the LCS, but was not recovered.
M1	Matrix Spike recovery above the acceptance limits.
M2	Matrix Spike recovery below the acceptance limits.
M4	The matrix spike failed high for the surrogate.
M5	The matrix spike failed low for the surrogate.
M6	The reporting limits were raised due to sample matrix interference.
M7	Recovery for matrix spike could not be quantified due to matrix interference.
M8	Analyte was spiked into the MS, but was not recovered.
M9	Analyte concentration was determined by the method of standard addition (MSA).
N1	The lab does not hold accreditation from PA-DEP for this parameter by this method
N2	PADEP does not accredit labs for this analyte by this method.
N3	The lab is accredited for this method in West Virginia, but not in PA (its primary accrediting body).
N4	PADEP does not accredit labs for this analyte by this method in drinking water.
ND	Not Detected.
O1	The flashpoint tester cannot detect below 50 degrees F.
O2	Result is temperature of the sample when flame observed. No flash observed. Result qualified.
O4	Sample was received with headspace.
O5	Sample was received in incorrect container and is not compliant with 40CFR136 Table II.
O6	Insufficient sample volume was received to comply with the method.
P1	The pH of the sample was >2 and is not compliant with 40CFR136 Table II.
P2	Sample contained residual chlorine and is not compliant with 40CFR136 Table II
P3	The pH of the sample was <10 and is not compliant with 40CFR136 Table II.
P4	Field preservation does not meet EPA or method recommendations for this analysis.
P5	Acid preservation may not be appropriate for the analysis of 2-Chloroethylvinyl ether.
P6	Sample required additional preservative upon receipt.
P7	The sample was received unpreserved.
P8	The pH of the sample was < 9 and is not compliant with 40 CFR136 Table II.
Q1	Qualified Data See Case Narrative.
Q2	Reported lower result from the dual detector. See case narrative.
Q3	Sample detected multiple Aroclors. See case narrative.
Q4	Weathering or degradation observed for PCBs. See case narrative.
Q5	Positive PCB interference qualified in peak(s) that cannot be removed. See case narrative.
Q6	Peak Height/Area used in quantification is documented in the case narrative.

R	Relative Percent Difference (RPD) was above the control limit.
R1	RPD above control limits between matrix spike and MS duplicates.
R2	RPD above the control limit between duplicates.
R3	RSD above the control limit between replicates.
R4	RPD above control limits between Inorganic Carbon check and spike.
R5	RPD above control limits between control sample and control sample duplicates.
R6	Dual Column/Detector RDP >40%. Higher result reported.
S	Recovery for the spiked control sample outside accepted limits.
S2	Surrogate recovery in the blank was below the control limit.
S3	Surrogate recovery in the blank was above the control limit.
S4	Surrogate recovery in the LCS is above the control limit.
S5	Surrogate recovery in the LCS is below the control limit.
SR	Analyte recovery was outside the accepted recovery limits and above the control limit for RPD.
T	Sample temperature received outside the regulatory limit and is not compliant with 40CFR Part136 Table II (for NPW samples).
T1	Sample temperature received outside the regulatory limit. (Primarily for SCM samples).
TC	The MS tune check (tailing factor) did not meet the acceptance criteria.
U	The analyte was not detected at or above the listed concentration, which is below the laboratory quantitation limit.

Note 1: Other comments to clarify test results may be used. Examples include MCL (Contaminant Limit), and MDA (minimum detectable activity). The Q1 code requires additional qualifier information be described in the Case Narrative.

Note 2: NA is used in the Laboratory QC report as “Not Applicable.”

APPENDIX C

MUNICIPAL LANDFILL CLOSURE CAP
INSPECTION REPORT

FIRST SEMI-ANNUAL 2025

The Hutchinson Group, Ltd.

Municipal Landfill Closure Cap Inspection Report

Reporting Period: First Semi-Annual 2025 **Date of Inspection:** 3/25/25

Section 1 - Facility			
Name of Facility: Amcelle Rubble Fill			
Owner of Facility: Allegany County, MD			
Location Address: Allegany County, MD			
Latitude :	39 35.776	Longitude:	78 49.120
Closure Cap Area completion date: 9/23/2010		Approximate cap area: 25 acres	
Inspectors: Alex Balog		Inspection date: 3/25/25	

Section 2 - Vegetation	
Type(s) of growth (check all that apply): ☒ grasses ☐ legumes ☐ herbaceous plants ☒ other (specify: *small shrubs*)	Remarks: *Uniform grass cover*
Condition of growth: ☒ Excellent (thick growth) ☐ Good ☐ Poor (thin growth, bare soil, etc.)	Remarks: *Uniform thick & healthy coverage*
Woody plants present? ☐ Yes ☒ No	Remarks: *None on the cap, only some small growth around perimeter of cap*
Invasive plants present? ☐ Yes ☐ Phragmites ☐ Other ☒ No	Remarks: *None observed on or near landfill cap*
Dead spots present? ☐ Yes ☒ No	Remarks:

Municipal Landfill Closure Cap Inspection Report

Reporting Period: First Semi-Annual 2025 **Date of Inspection:** 3/25/25

Section 3 – Final Cover Condition	
Is there subsidence (depressions in the cap)? ☐ Yes ☒ No	Remarks:
Is there any evidence of water ponding on the cap? ☐ Yes ☒ No	Remarks: *Cover grading in good condition*
Are there colored leachate seeps through the cap? ☐ Yes ☒ No	Remarks:
Are there colored leachate seeps at toe slope? ☐ Yes ☒ No	Remarks:
Are there signs of burrowing animals? ☐ Yes ☒ No	Remarks: *None observed*
Is there any waste pushing through the cap? ☐ Yes ☒ No	Remarks:
Does the cap cover all of the solid waste? ☒ Yes ☐ No	Remarks:
Is there evidence of erosion? ☐ Yes ☒ No	Remarks:
Is there vehicle tracking damage to the cap or vegetation? ☐ Yes ☒ No	Remarks:

Municipal Landfill Closure Cap Inspection Report

Reporting Period: First Semi-Annual 2025 **Date of Inspection:** 3/25/25

Section 4 - Drainage and Surface Water	
Conditions/Stability of streams/swales/ditches etc. ☒ Excellent (unobstructed) ☐ Good /Fair ☐ Poor (overgrown or sediment filled)	Remarks:
Is there evidence of colored leachate in surface waters? ☐ Yes ☒ No	Remarks:
Is there surface water monitoring? ☐ Yes ☒ No	Remarks:
Are results submitted to MDE? ☐ Yes ☒ No	Remarks: *N/A*

Section 5 - Groundwater	
Is there groundwater monitoring? ☒ Yes ☐ No	Remarks: *Semi-Annually*
Are results submitted to MDE? ☒ Yes ☐ No	Remarks: *Semi-Annually*
Condition of groundwater monitoring wells (if present): ☐ Excellent ☒ Good ☐ Poor (missing covers, missing locks, deteriorated seals, frost heaved, etc.)	Remarks:

Municipal Landfill Closure Cap Inspection Report

Reporting Period: First Semi-Annual 2025 **Date of Inspection:** 3/25/25

Section 6 - Landfill Gas (LFG) Management System	
Is there an LFG collection system? ☐ Yes ☒ No	Remarks *Passive ventilation on the cap.*
Are the LFG wells damaged? ☐ Yes ☒ No	Remarks:
Is LFG monitoring done? ☒ Yes ☐ No	Remarks: *Quarterly*
Are results submitted to MDE? ☒ Yes ☐ No	Remarks: *Semi-Annually*
Does the LFG produce any odors? ☐ Yes ☒ No	Remarks:

Section 7 - Other Facility Conditions	
Condition of Access Roads? ☒ Good ☐ Fair ☐ Poor	Remarks:
Is there litter present? ☐ Yes ☒ No	Remarks:

Municipal Landfill Closure Cap Inspection Report

Reporting Period: First Semi-Annual 2025 **Date of Inspection:** 3/25/25

Section 8 – Corrective Actions (Describe any corrective actions planned or taken as a result of conditions noted during the inspection)
N/A
