## VICINITY MAP

## **INTRODUCTION**

Abingdon Business Park is located between Edgewood Road and Abingdon Road, south of I-95, west of the Town of Abingdon in Harford County, Maryland. The site encompasses approximately 326.4 acres. Plans for the development of this site include retail and commercial areas, large scale distribution, warehouse areas and the associated infrastructure (streets, open space, utilities, etc.). Several existing residential developments border the property, including Autumn Run and Pomeroy Manor. The site is accessible to Edgewood Road and Abingdon Road.

The purpose of this report is to present our hydrologic and hydraulic analysis for Haha Branch and two unnamed tributaries from now on called "UT-1" and "UT-2". Haha Branch flows from north to south through the western portion of the site with a drainage area of 837.09 acres. UT-1 and UT-2 combined drainage area is 133.42 acres. The study reach extends from the point where the stream meets the north property line to a point 150 ft. downstream of the existing culvert at Philadelphia Road and into the Bush River (Use I waters). The study along this portion of the stream includes a proposed 220' bridge along Edgewood Road spanning Haha Branch and two proposed culverts crossing the unnamed tributaries.

## **LAND COVER AND TOPOGRAPHY**

The entire on-site area is classified as woods, the off-site areas are 48% residential, 18% commercial, 19% woods, 11% open space and 5% other paved and impervious areas. The site elevations range from a minimum of approximately 18 feet above mean sea level to 160 feet above mean sea level. The Haha Branch exhibits an average bed slope of 0.7% over the 8500-foot length of the study.

Aerial photogrammetry, field survey and County topographic maps were used to study the area.

All elevations published in this report are on the NAVD '88 datum.

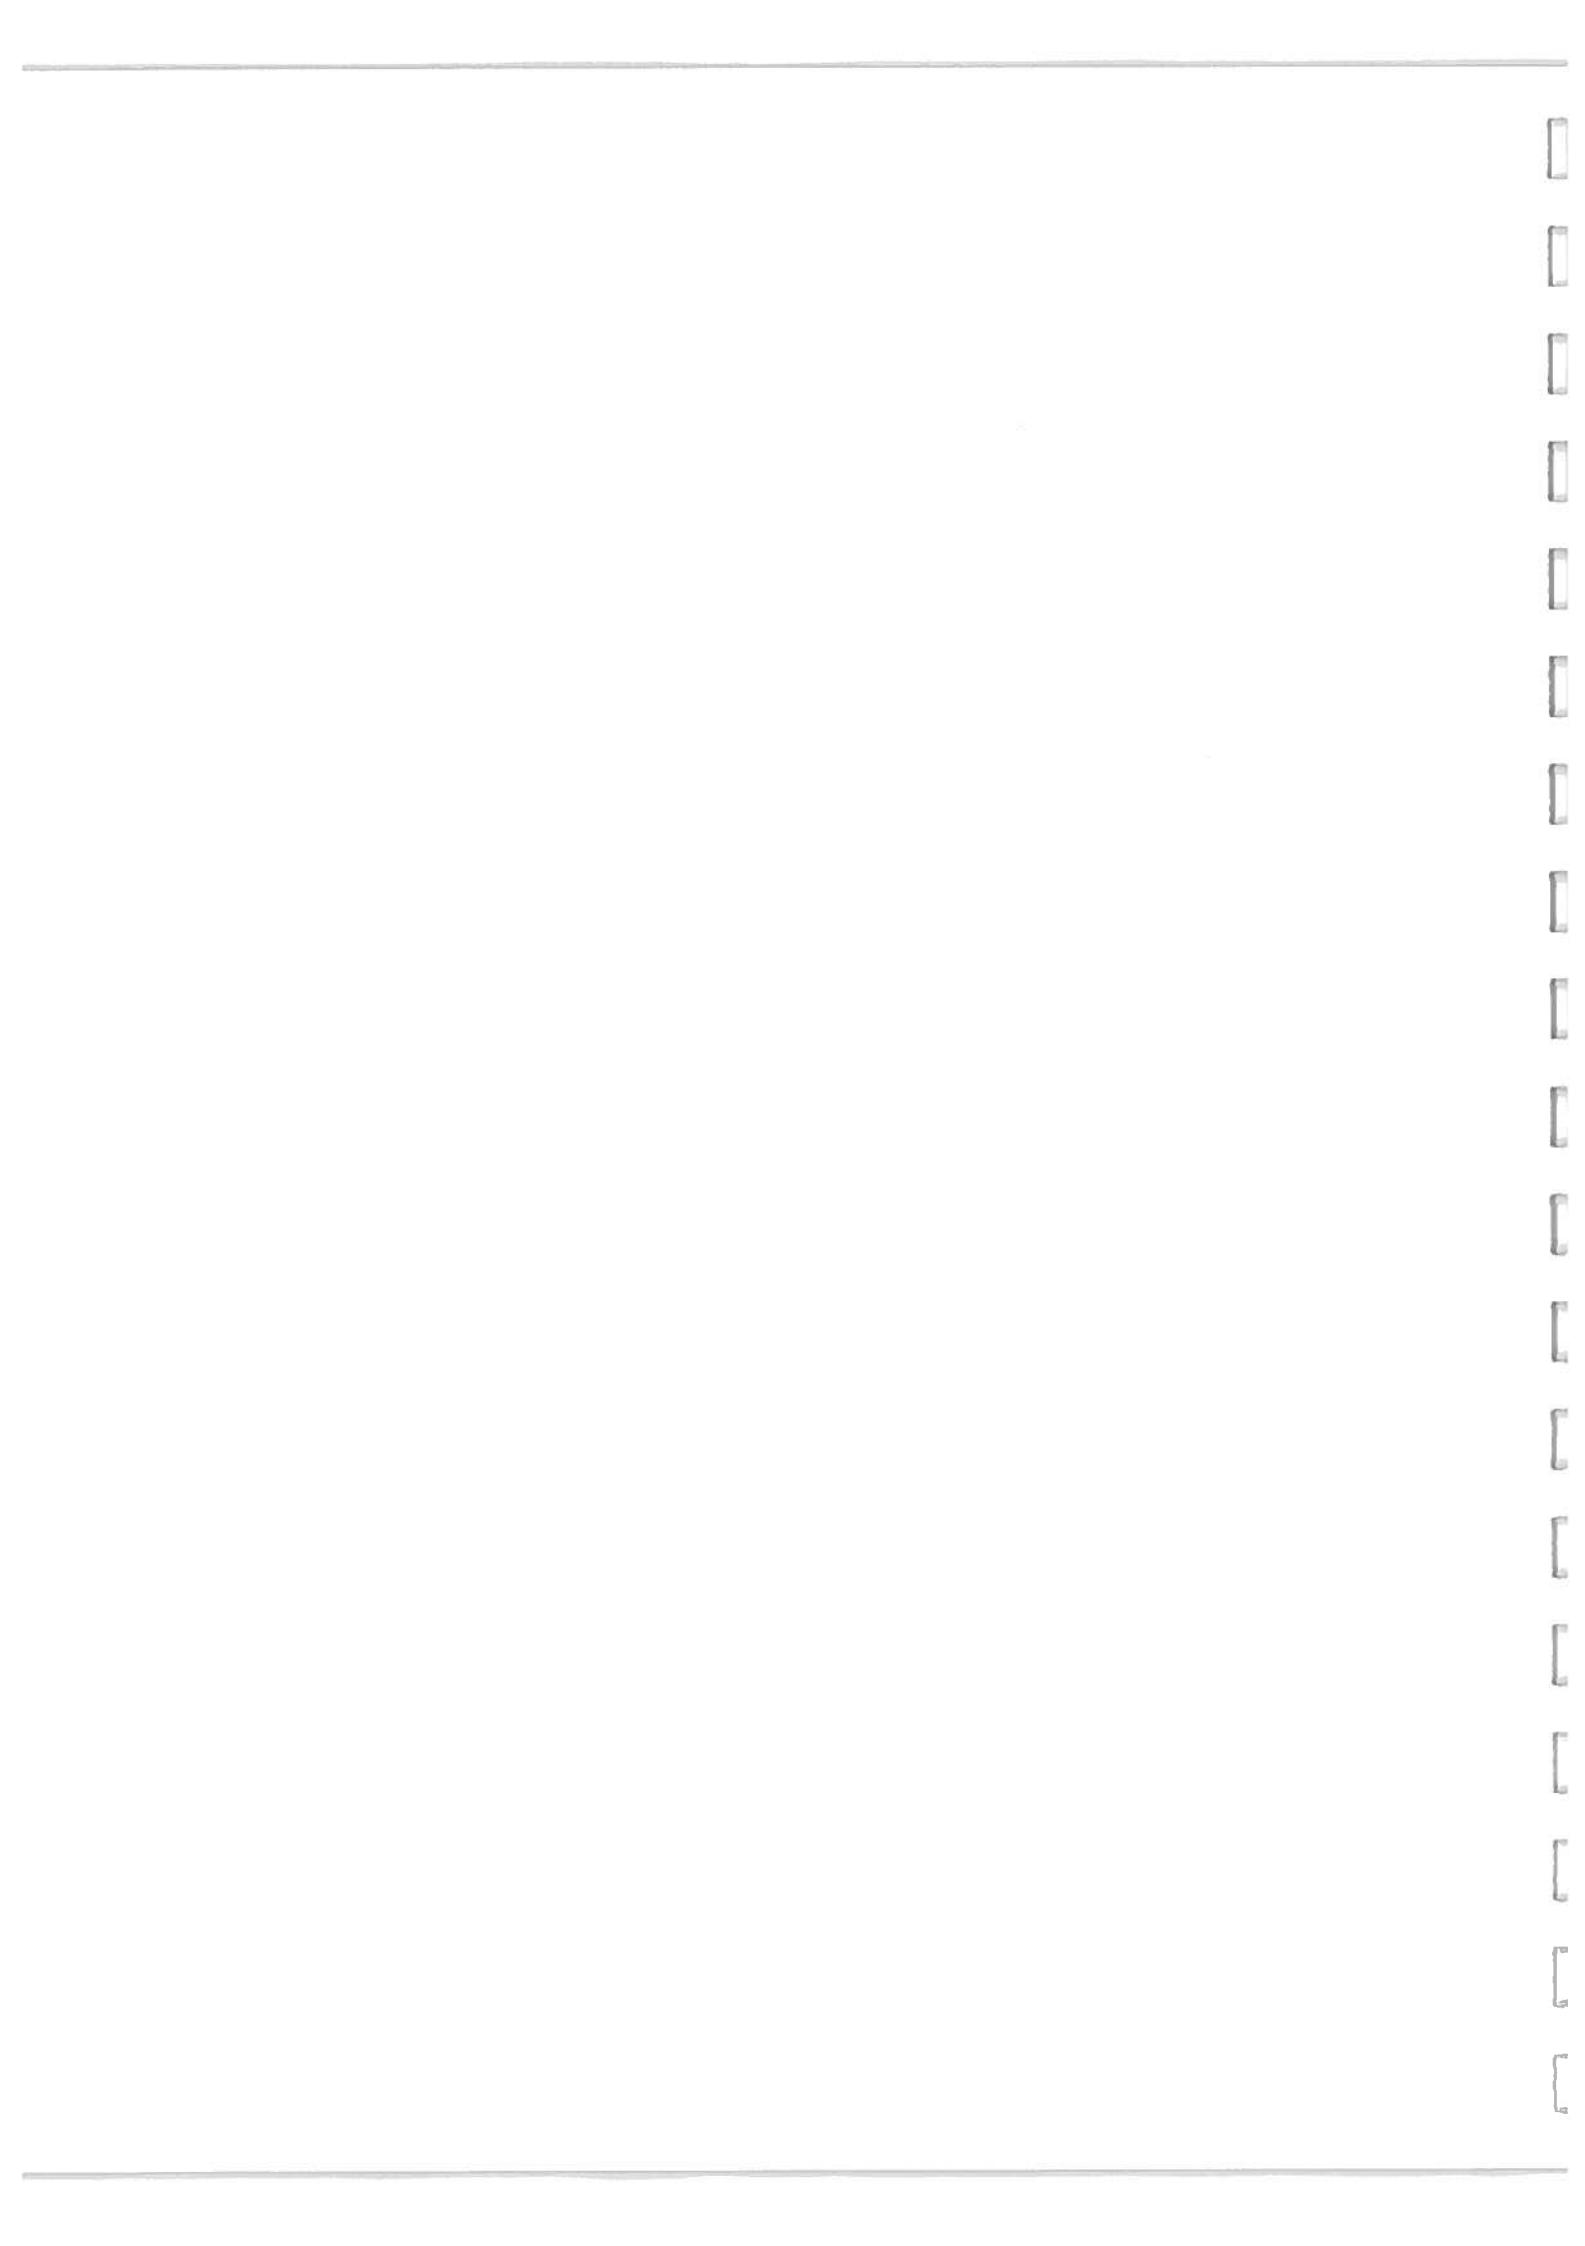

## **METHODOLOGY**

### **HYDROLOGY**

The hydrologic method used in this study is the USDA, NRCS Runoff Curve Number Method. TR-55 was used to calculate curve numbers and times of concentration, which were then input with other data into the TR-20 computer program. The watershed was mapped using the County's topographical maps for off-site areas. The total watershed above Philadelphia Road encompasses approximately 1190 acres.

As prescribed in COMAR, the 2, 10 and 100-year discharges were calculated. All discharges published in this report assume fully developed (i.e., ultimate) conditions within the watershed. As the vast majority of the watershed is developed, the existing land uses plans were used. The estimate of ultimate development runoff from off-site areas not fully built-out was based on current zoning. Soils were taken from the Harford County Soil Survey and off-site zoning was taken from the latest County zoning maps. The zoning and soil survey maps are located in Appendix A of this report.

Supplemental TR-55 computations are provided as Appendix B. The TR-20 output is provided as Appendix C. Our Drainage Area Map is included at the back of this report.

## HYDRAULICS

The Army Corps of Engineers' Hydrologic Engineering Center – River Analysis System (HEC-RAS), version 5.0.5., was used to model the water surface profiles along Haha Branch, UT-1 and UT-2. As prescribed in COMAR, the 2, 10 and 100-year storms were modeled. Channel dimensions and Manning's roughness coefficients were based on topographic maps, supplemented by field-run surveys and a visual inspection of the stream channel and over-banks. Refer to Figures 1 through 5 for representative photographs. A subcritical profile was used with critical depth as the upstream and downstream boundary conditions. Critical depth was used due to culvert conditions at each boundary.

As stated above, the Manning's 'n' values used in the HEC-RAS model were based on a visual examination of the stream channel and overbanks. The following is a list of 'n' values used in the hydraulic model:

- 0.035 stream channel, moderate vegetation
- 0.013 concrete pipes and culverts
- 0.1 overbank - heavy stand of timber with little undergrowth

## HYDRAULIC ANALYSIS

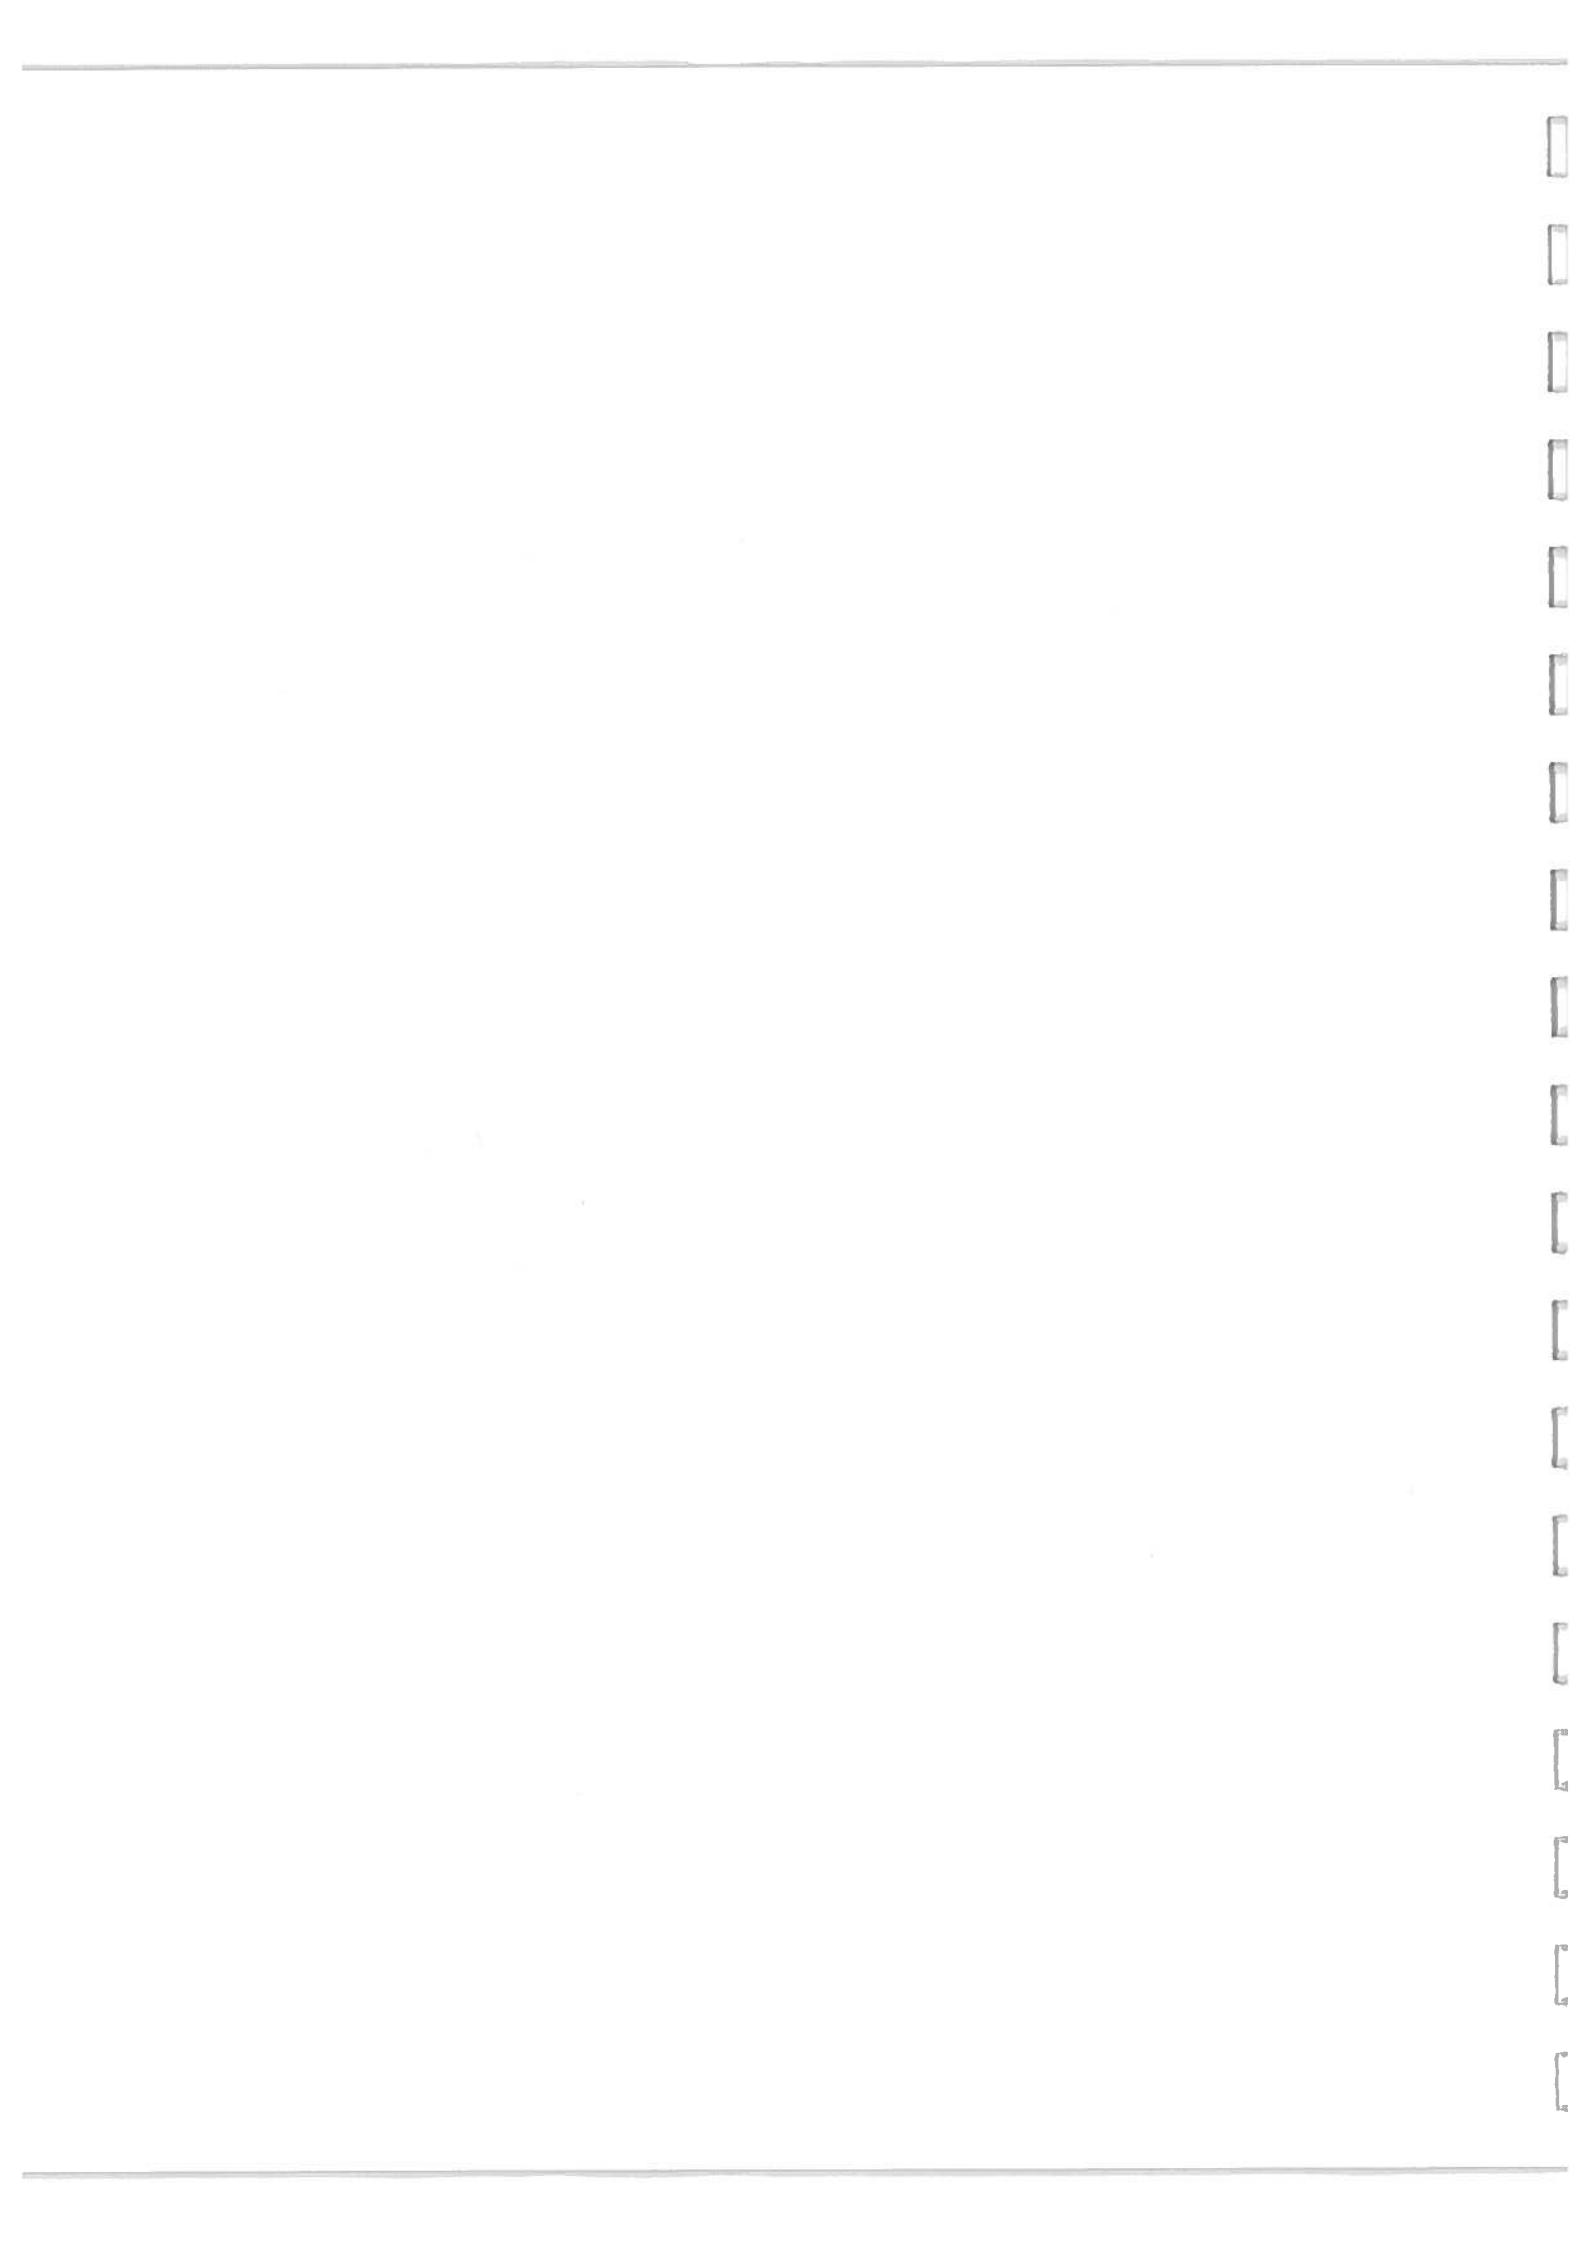

### SUMMARY OF HYDRAULIC COMPUTATION RESULTS

The stream was modeled using a mixed flow regime to determine the water surface elevations within the project. Table 1 below presents a summary of the calculated 100-year water surface elevations. The HEC-RAS summary output, profile, and section plots are provided as Appendix C.

The 100-year water surface elevations are plotted on the Workmap included at the back of this report and summarized in Table 1 below. Table 1 is provided only as a brief summary of the hydraulic analyses – for more detailed information refer to the HEC-RAS output provided in Appendix C. The following report demonstrates the proposed structures pass the 100-year storm event without overtopping in the proposed condition and all increases in WSEL are contained entirely within the subject property. No offsite properties are adversely impacted.

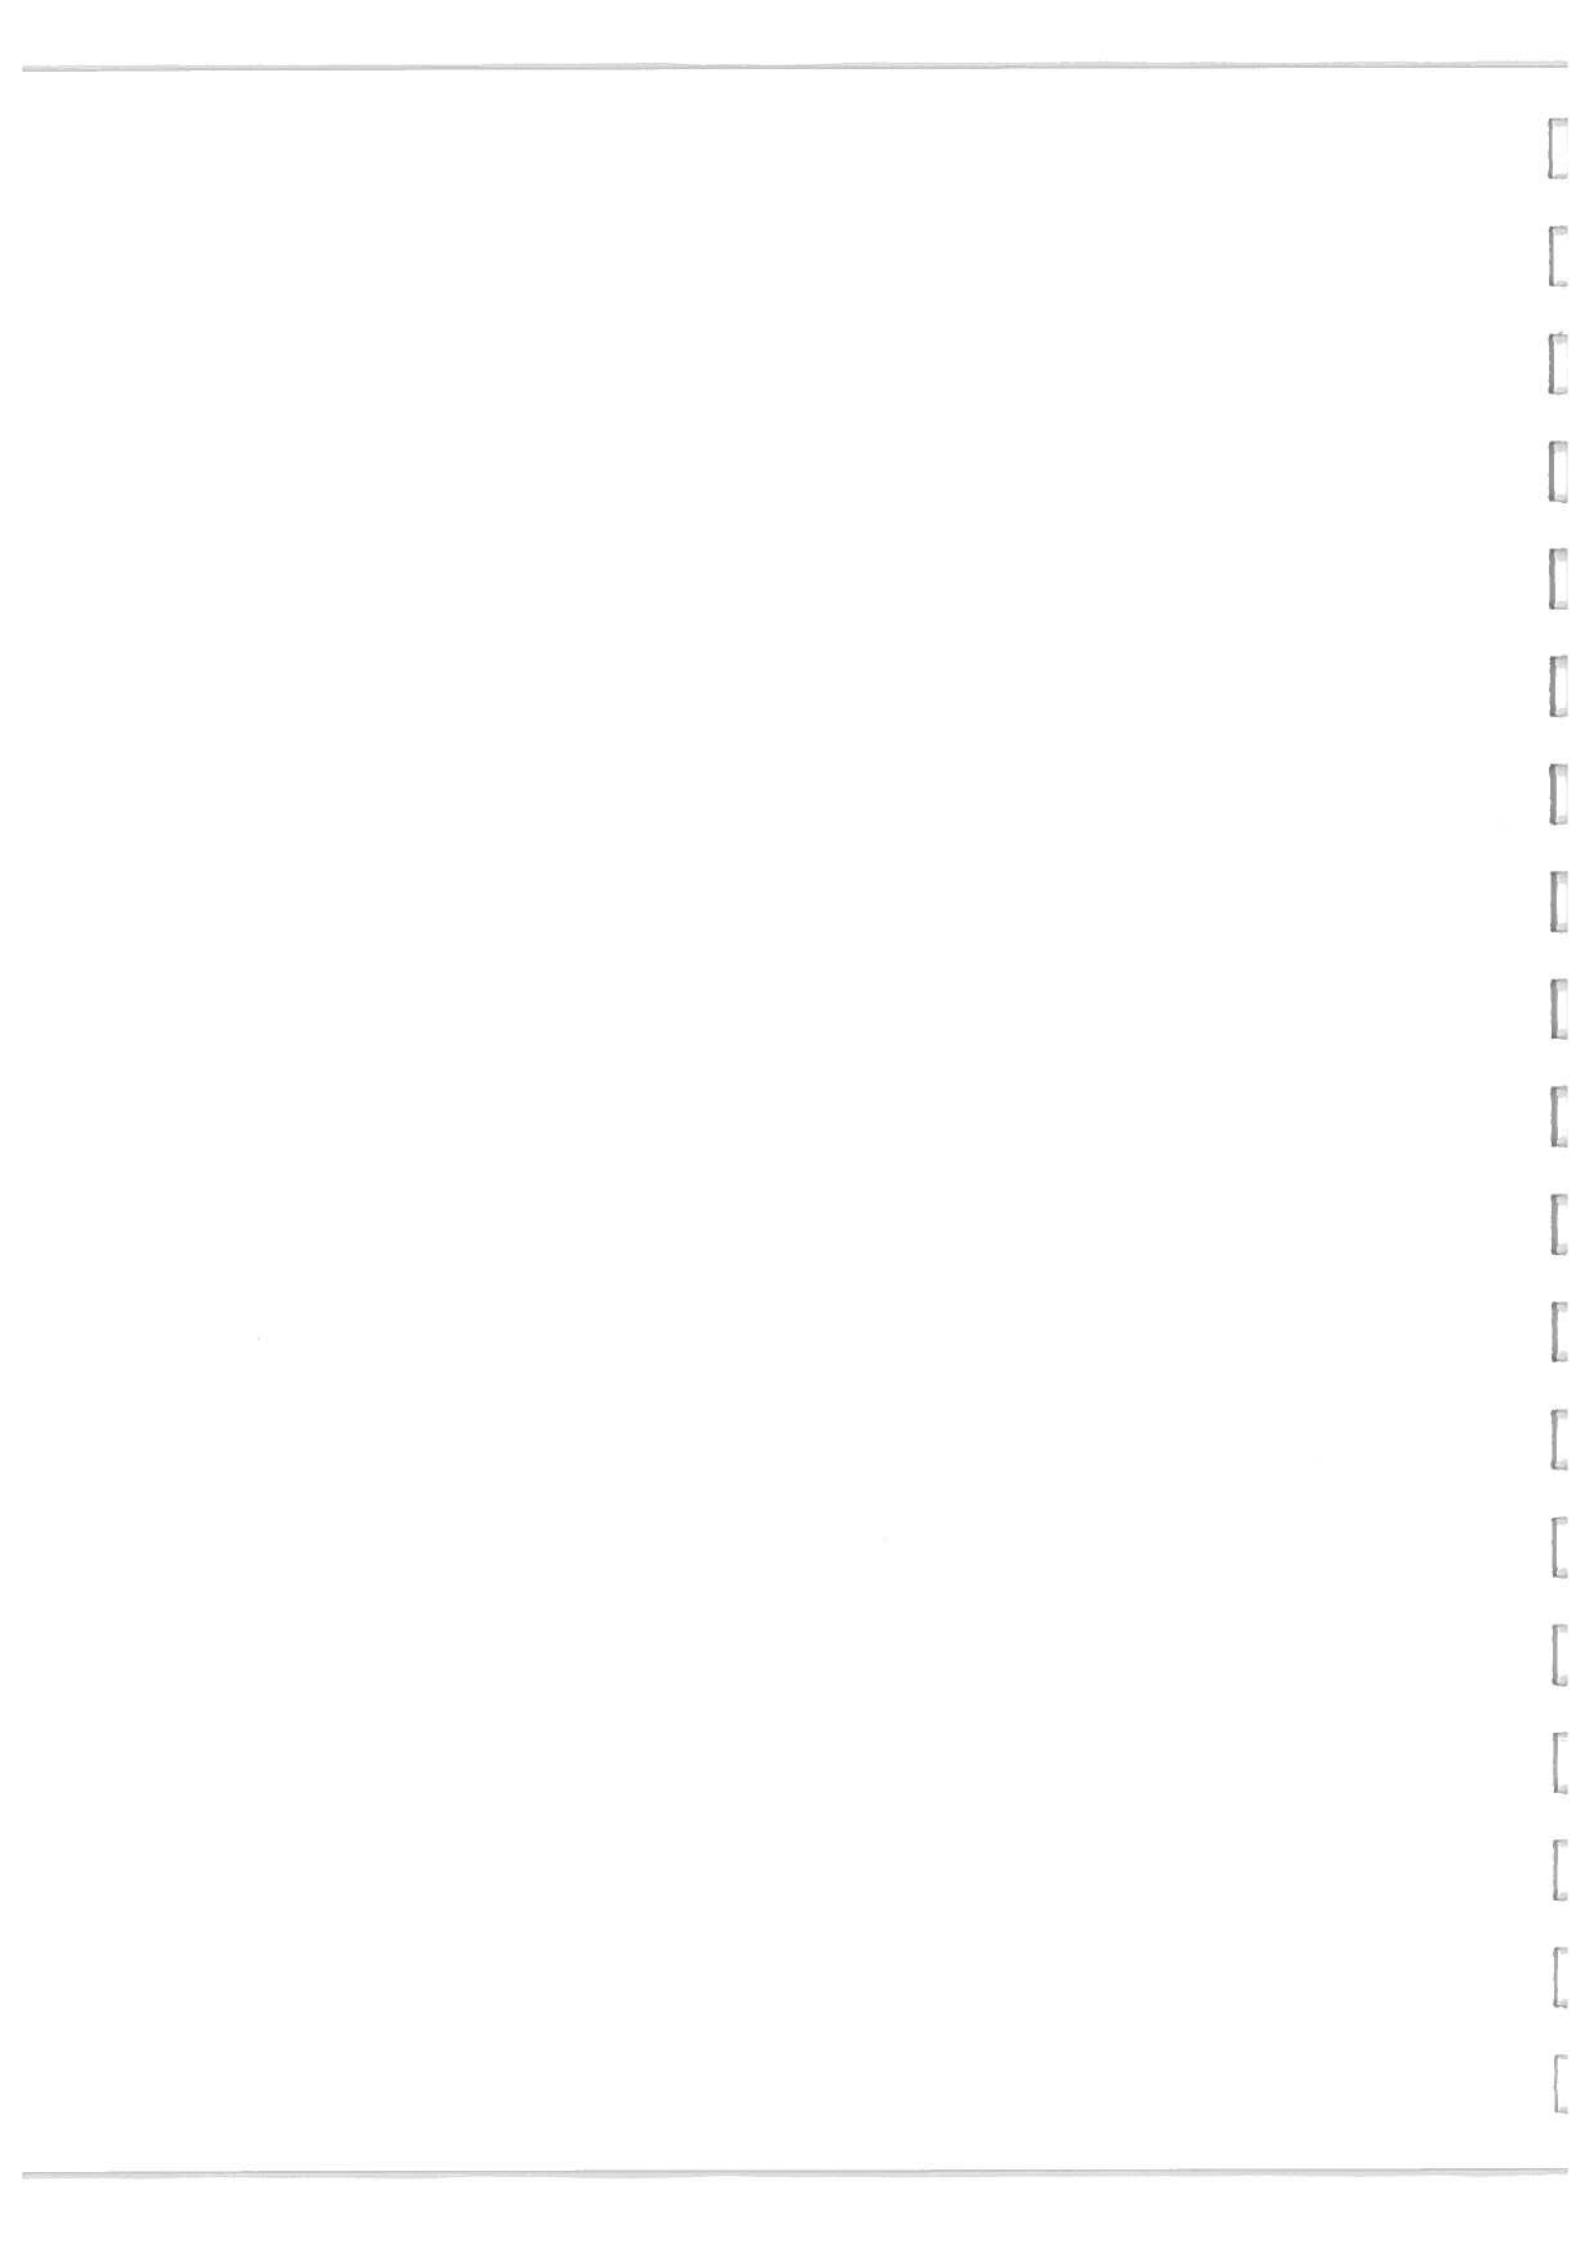

## PROPOSED STRUCTURES

Three proposed crossings were analyzed. A bridge crossing the Haha Branch at Edgewood Road will have a span of 220 ft. and three circular piers with 4 ft. of diameter located halfway between the abutments. For the crossing at UT-1, a culvert with 2 concrete pipes with diameters of 5 ft. and 7. is proposed. Lastly, a single 5 ft. diameter concrete pipe has been proposed for the crossing at UT-2.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Please rely on the bar scale on each map sheet for map measurements.

**Source of Map:** Natural Resources Conservation Service  
**Web Soil Survey URL:** [Web Mercator \(EPSG:3857\)](#)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

**Soil Survey Area:** Harford County Area, Maryland  
**Survey Area Data:** Version 12, Sep 14, 2018

Soil map units are labeled (as space allows) for map scales 1:30,000 or larger.

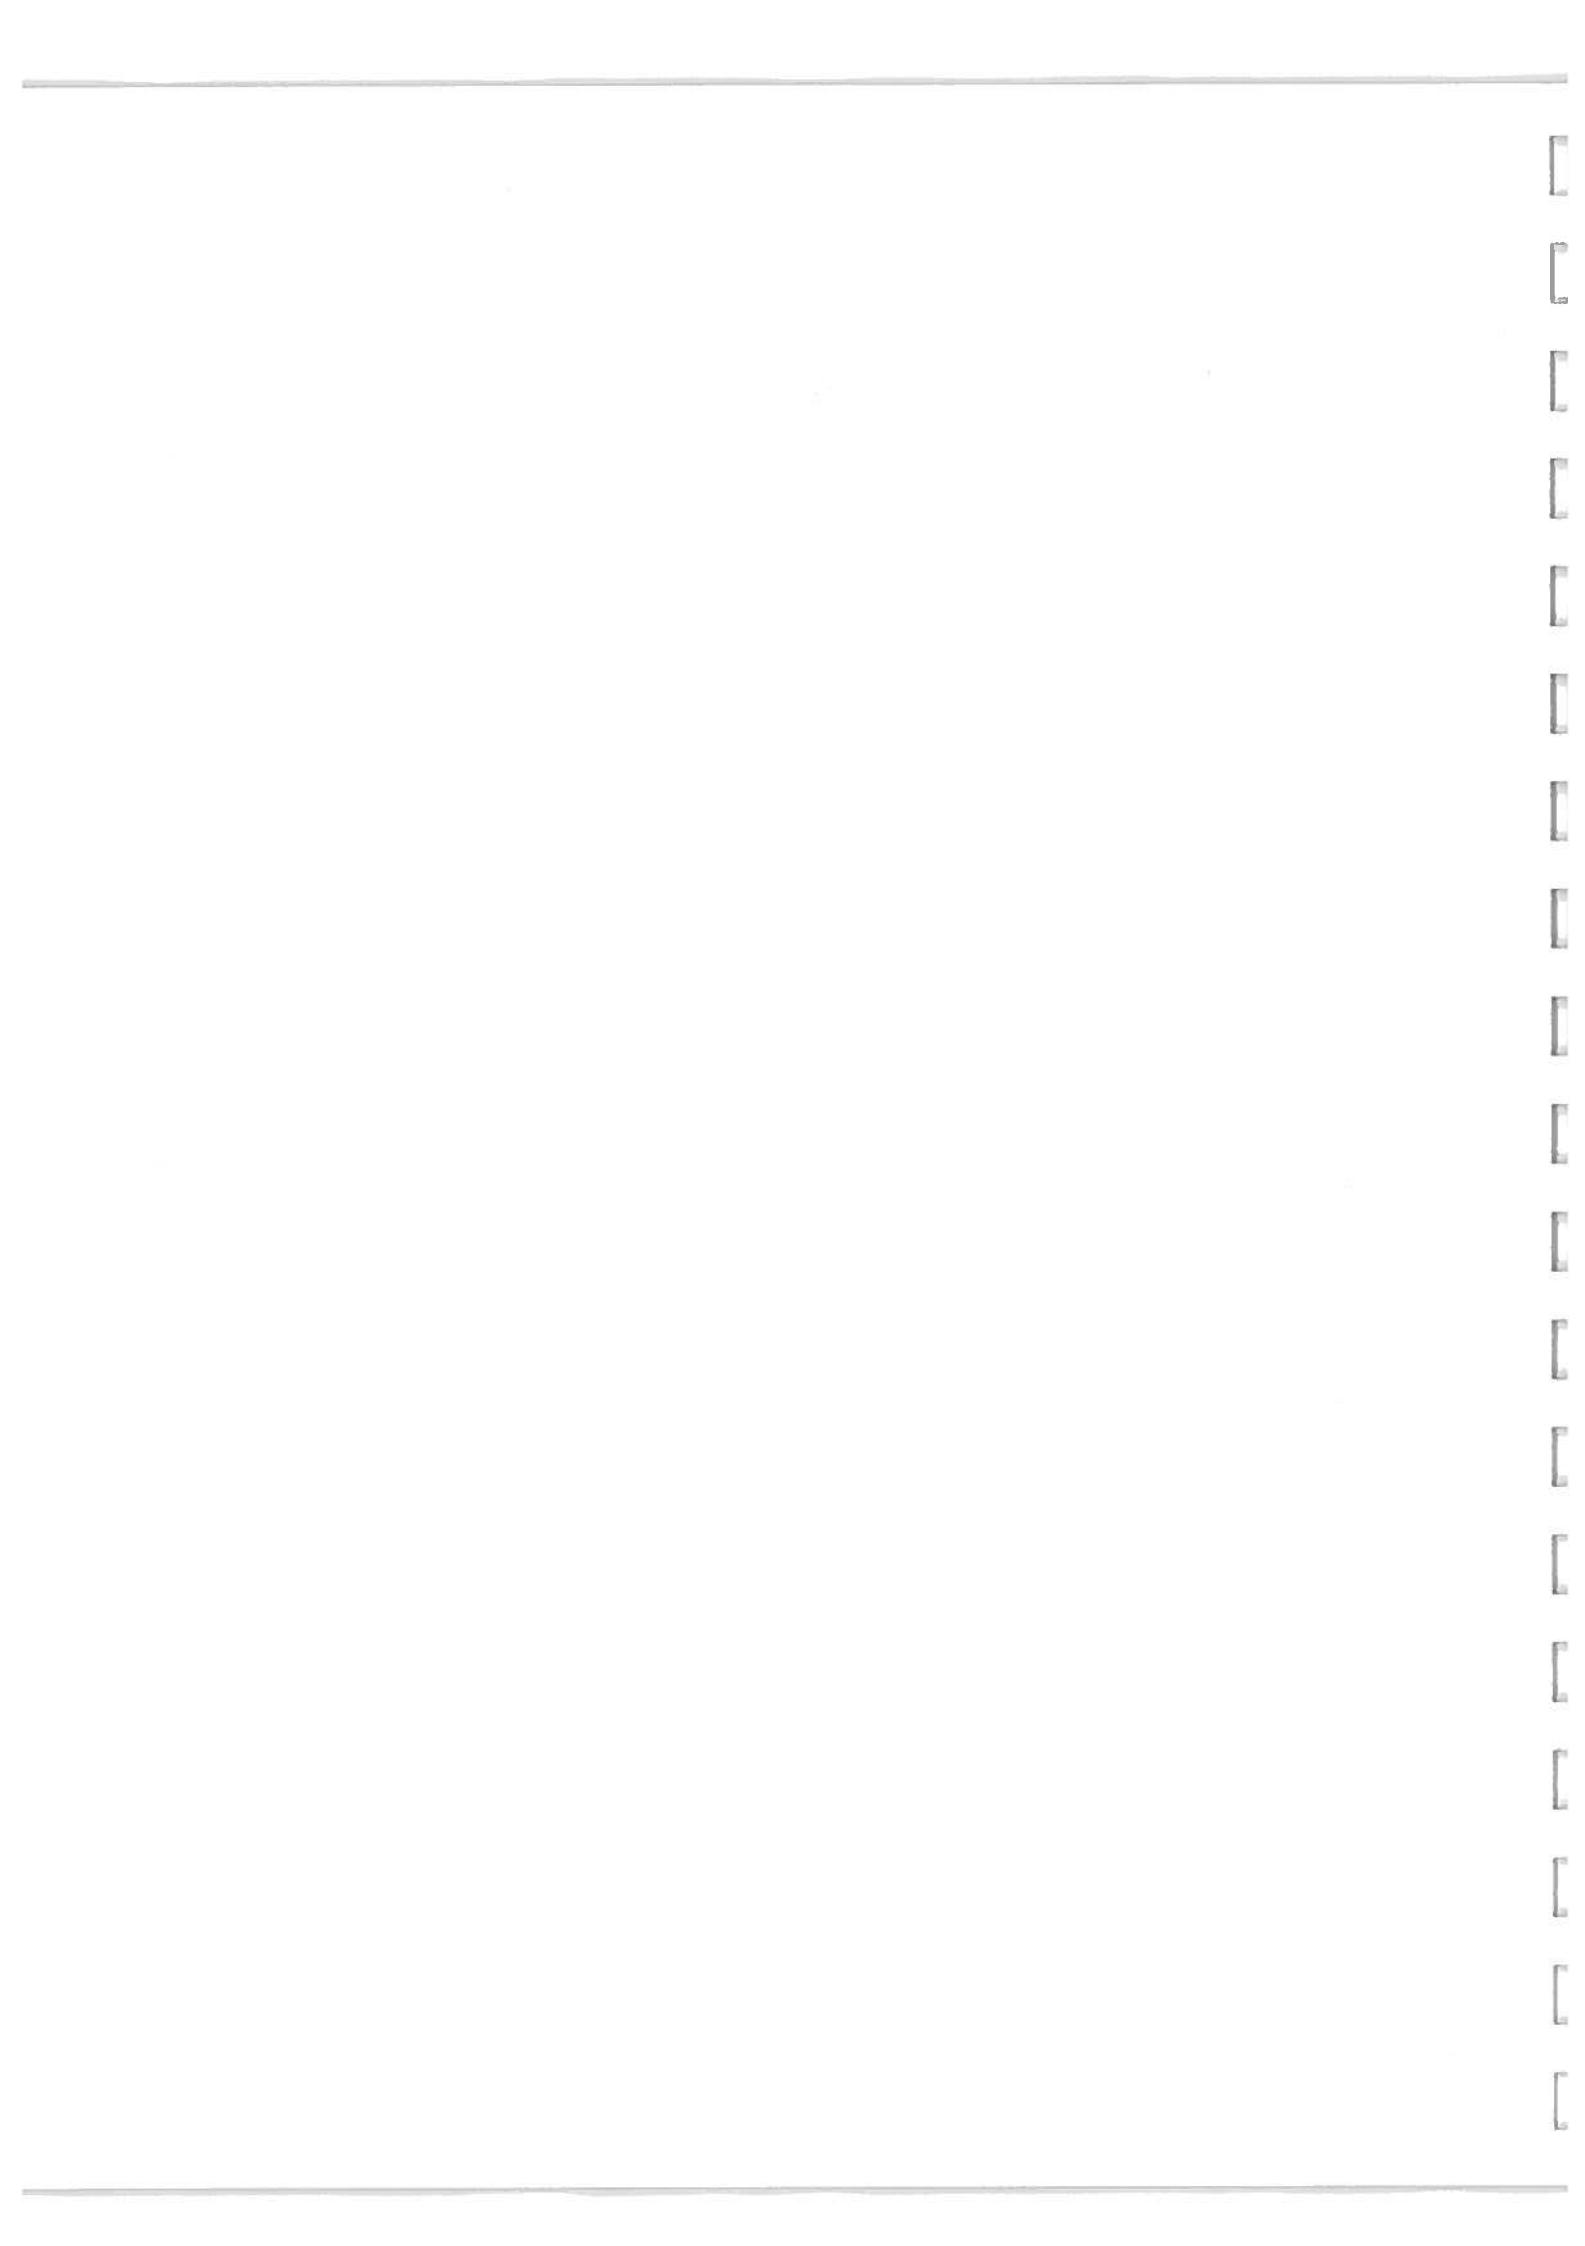

**Date(s) aerial images were photographed:** Jun 16, 2014—Oct 20, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

**Group A.** Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

**Group B.** Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

**Group C.** Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

**Group D.** Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

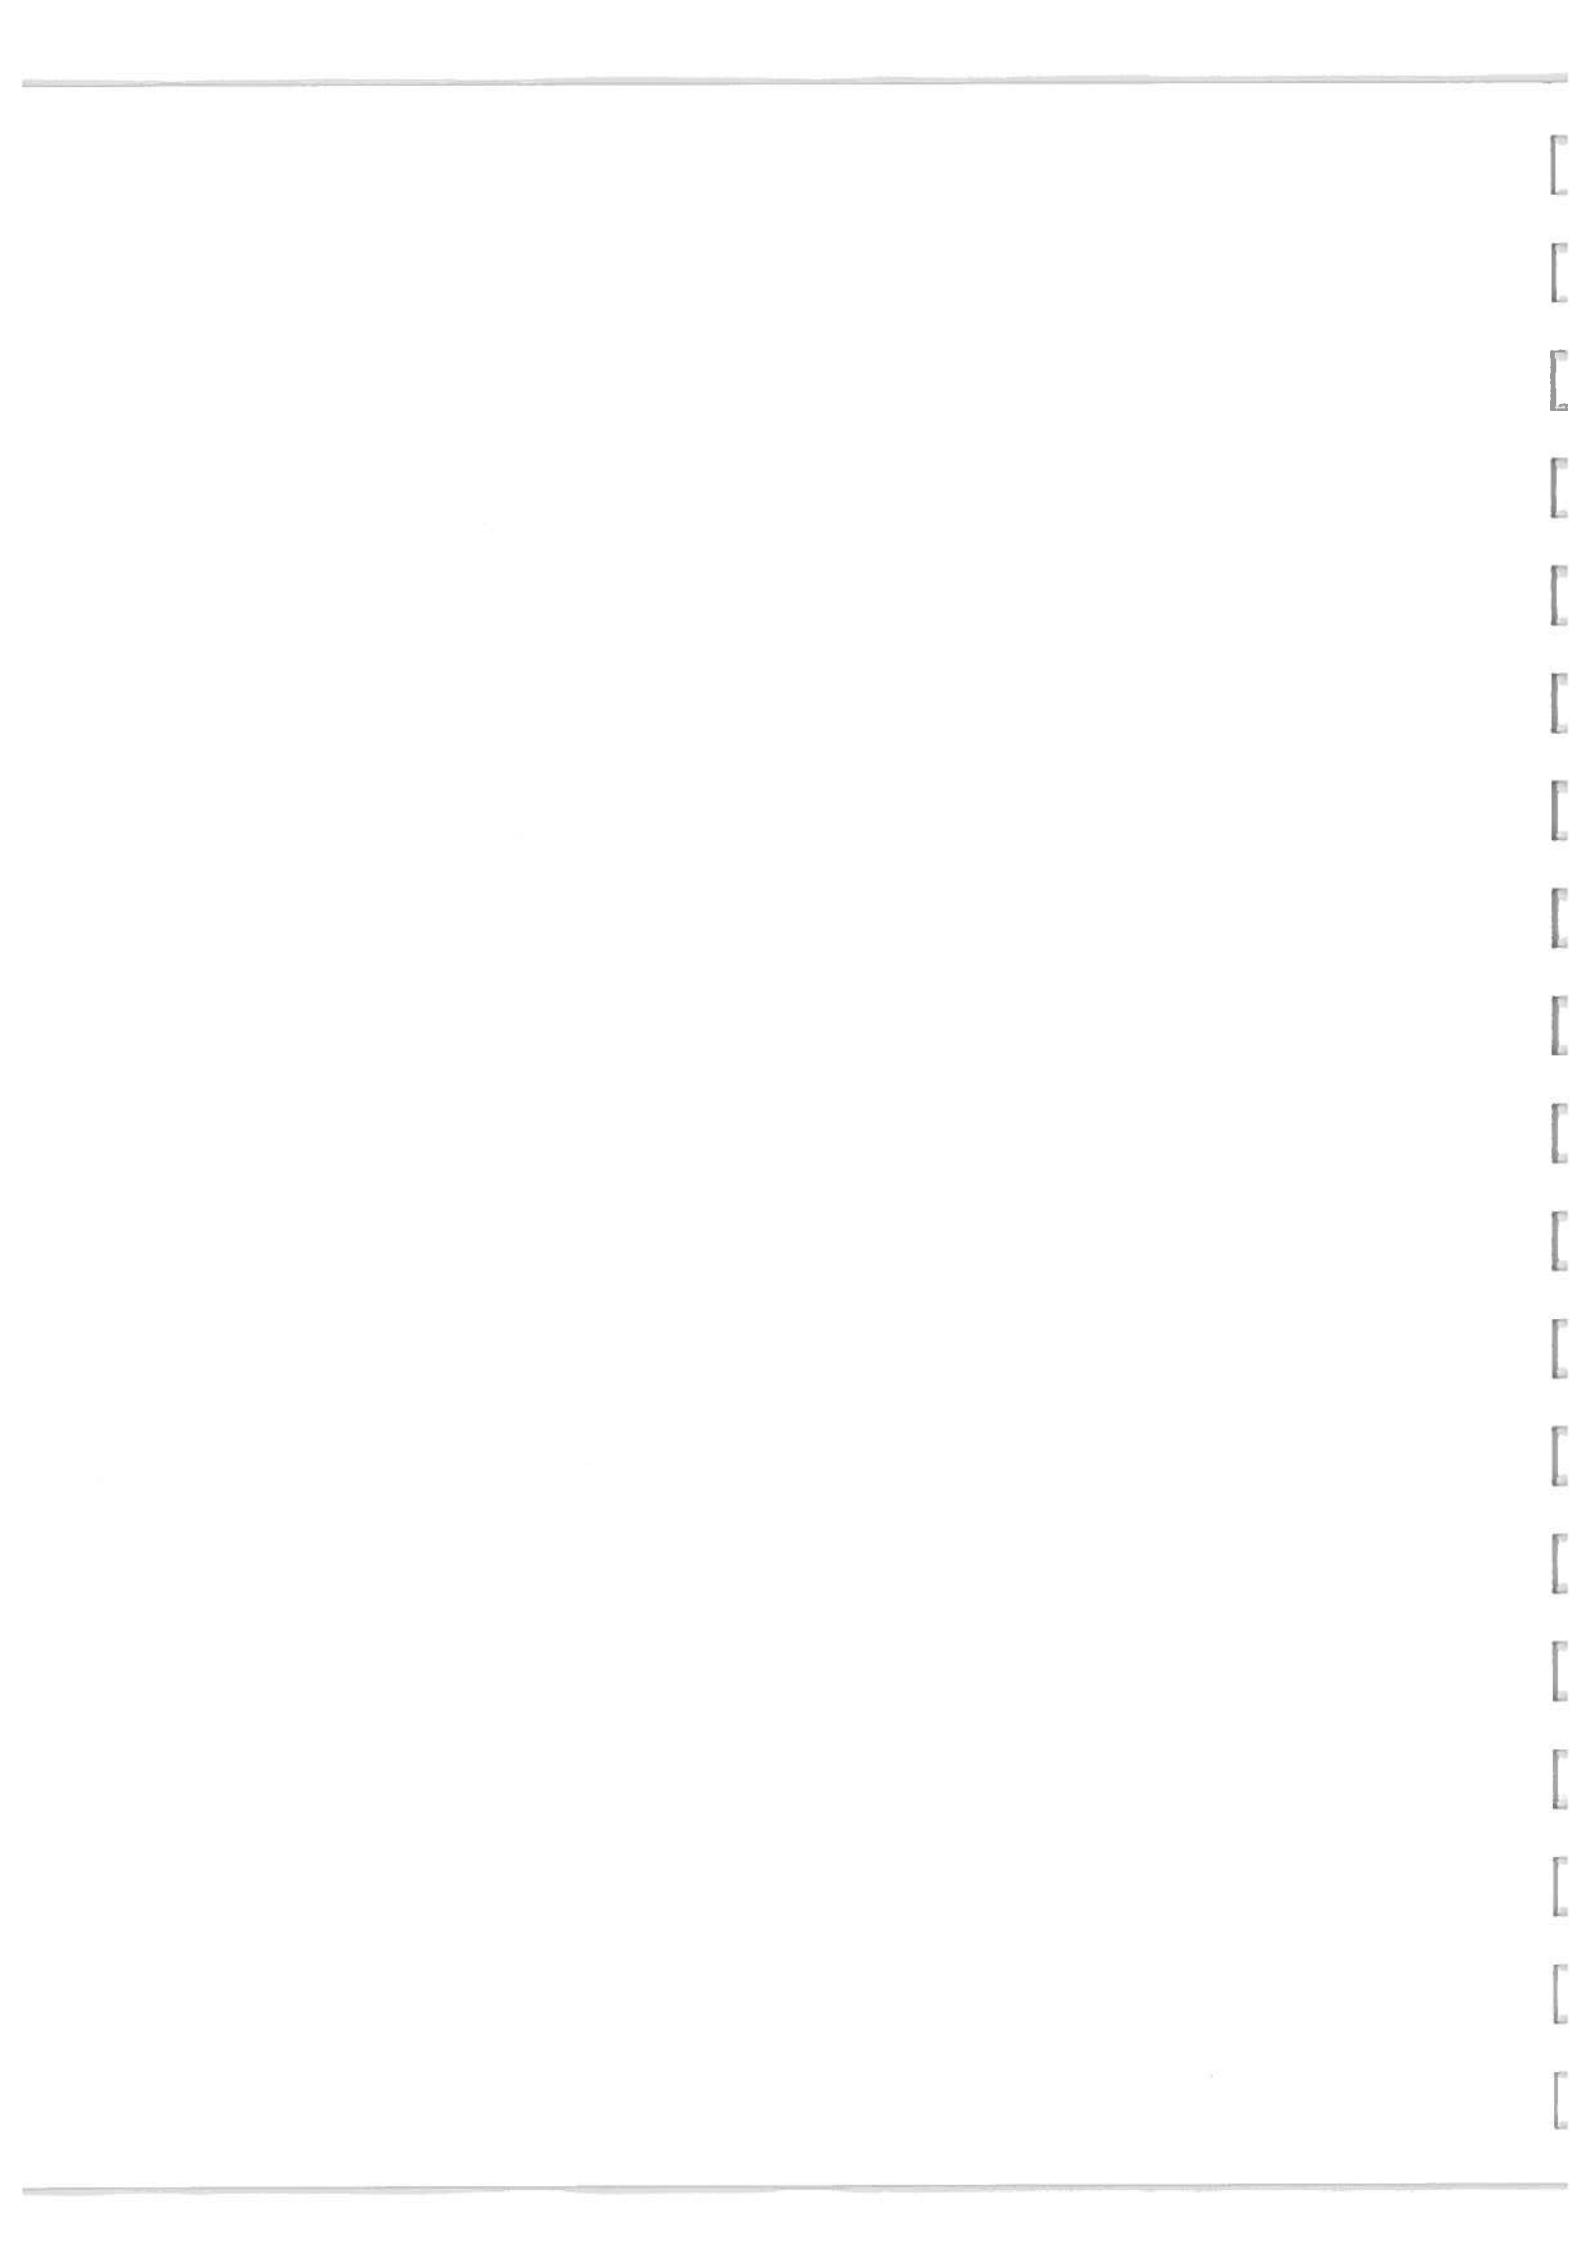

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

## Rating Options

## Cross Section for Irregular Section - 1

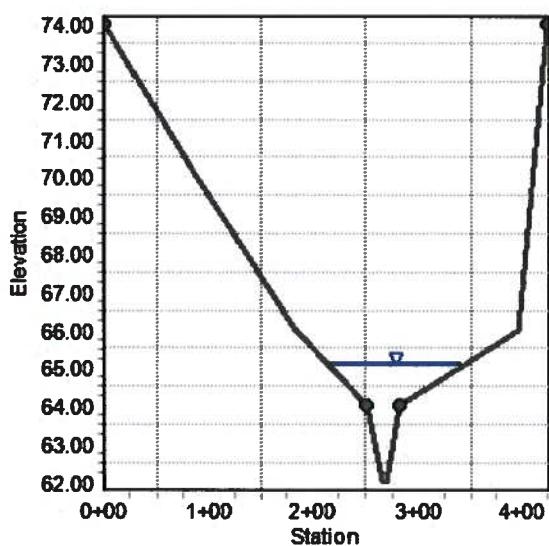

### Project Description

Friction Method                    Manning Formula  
Solve For                            Normal Depth

### Input Data

Channel Slope	0.00560 ft/ft
Normal Depth	3.04 ft
Discharge	200.00 ft <sup>3</sup> /s

### Cross Section Image

## Cross Section for Irregular Section - 2

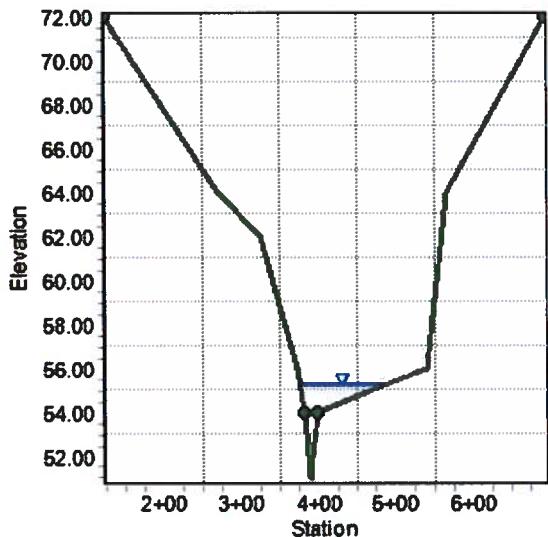

### Project Description

Friction Method                    Manning Formula  
Solve For                         Normal Depth

### Input Data

Channel Slope                    0.00790 ft/ft  
Normal Depth                    4.23 ft  
Discharge                        200.00 ft³/s

### Cross Section Image

## Cross Section for Irregular Section - 3

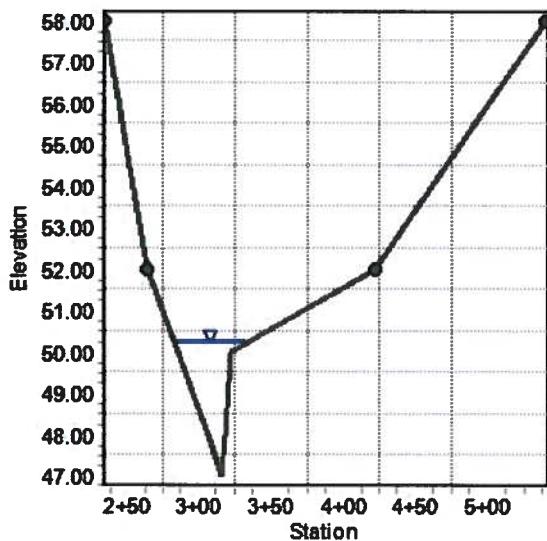

### Project Description

Friction Method      Manning Formula  
Solve For              Normal Depth

### Input Data

Channel Slope              0.00510 ft/ft  
Normal Depth              3.20 ft  
Discharge              200.00 ft<sup>3</sup>/s

### Cross Section Image

## Cross Section for XSECTN-4

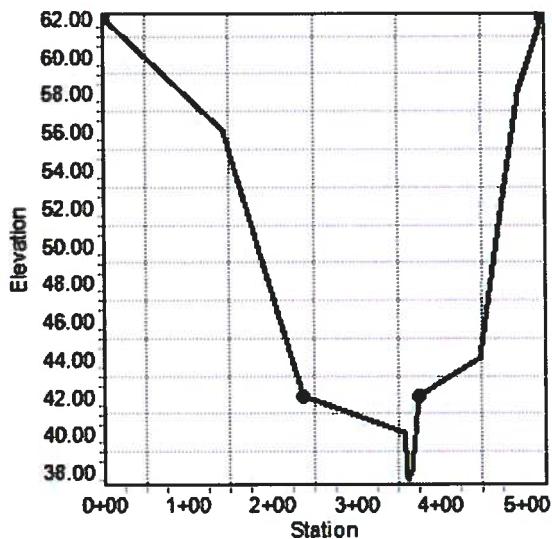

### Project Description

Friction Method      Manning Formula  
Solve For              Discharge

### Input Data

Channel Slope              0.00920 ft/ft  
Normal Depth                162.50 ft  
Discharge                    2572545.12 ft³/s

### Cross Section Image

## Cross Section for Irregular Section - 5

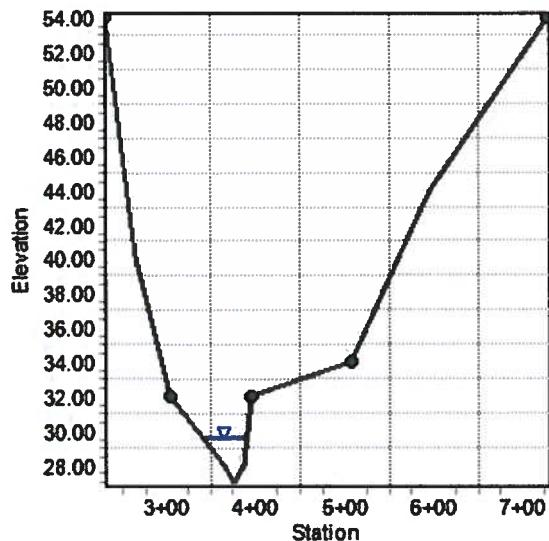

### Project Description

Friction Method                    Manning Formula  
Solve For                            Normal Depth

### Input Data

Channel Slope                    0.00540 ft/ft  
Normal Depth                      2.54 ft  
Discharge                          200.00 ft³/s
