

This document provides a summary of the results from Phase 5 of the Maryland Department of the Environment (MDE)'s Public Water System (PWS) study for per- and polyfluoroalkyl substances (PFAS), which took place between 2023 and 2025. A PWS provides water for human consumption to at least 15 service connections or serves an average of 25 people for at least 60 days a year. Phase 5 focused on sampling all Non-Transient Non-Community Water Systems (NTNC). A NTNC is a PWS that regularly supplies water to at least 25 of the same people at least 6 months per year, but does not meet the definition of a Community Water System (CWS). A CWS is a PWS that supplies water to the same population year-round. Maryland's approximately 450 CWSs were sampled between 2020 and 2022. Some examples of NTNC are schools, factories, and office buildings.

On April 10, 2024, the EPA established federal drinking water standards for 6 PFAS compounds under the Safe Drinking Water Act. Enforceable Maximum Contaminant Levels (MCLs) for PFOA and PFOS were set at 4 parts per trillion (ppt), MCLs for PFHxS, PFNA and HFPO-DA were set at 10 ppt, and a Hazard Index was set for a combination of 4 compounds (PFHxS, PFNA, HFPO-DA and PFBS). CWSs and NTNCs will be required to sample for these contaminants starting in 2027 and report results to their customers. Starting in 2029, systems will be required to achieve the drinking water limits and notify customers of violations.

From July 2023, to January 2025, MDE collaborated with the Maryland Department of Health (MDH) to collect and analyze 573 drinking water samples from 441 NTNCs. Based on Phase 5 results, MDE recommended that systems conduct certain actions such as notifying their customers, continuing to monitor PFAS in their drinking water, and implementing PFAS reduction measures. MDE also worked with systems to connect them to funding for remediation through the Infrastructure Investment and Jobs Act (Bipartisan Infrastructure Law). All Phase 5 sample results can be found in **Appendix A** of this report.

### MDE's Previous Public Water System Monitoring

In September 2020, MDE initiated its multi-phased PWS study for PFAS in drinking water. Phases 1, 2, 3 and 4 of MDE's PWS Study were completed between September 2020 and December 2022. Under Phases 1 and 2, water systems were selected and prioritized based on the following:

- Consumer potential for long-term exposure to PFAS (if present) (i.e., CWS customers vs Non-Transient Non-Community (NTNC) customers)
- Drinking water source vulnerabilities (e.g., surface waters and groundwater from unconfined and semi-confined aquifers)

• Proximity and relative risk to potential PFAS sources (i.e., CWS source water is located within 1,000 ft (Phase 1) or 1 mile (Phase 2) of one or more potential sources of PFAS)

Under Phase 1, PFOA and/or PFOS were detected in approximately three-quarters of samples; about half of the samples tested during Phase 2 had PFOA and/or PFOS detections. Because of the high levels of detection for PFOA and PFOS, MDE continued its monitoring efforts under Phase 3 and tested the remaining CWSs in the state. On June 15, 2022, the EPA released interim health advisories for PFOA and PFOS in drinking water at 0.004 parts per trillion (ppt) and 0.02 ppt, respectively. In response to these lower levels, MDE initiated Phase 4 sampling, which looked at CWSs with previous detections of PFOA and PFOS (during Phases 1 through 3). Samples taken during Phases 1 through 4 were tested for 18 PFAS analytes under EPA Method 537.1.

### MDE PWS Study – Phase 5 Monitoring Approach

In July 2023, MDE initiated the fifth phase of its PWS study to evaluate and determine the occurrence of PFAS in drinking water in NTNC water systems. During this phase, 573 drinking water samples from 441 water systems were collected and tested for 25 PFAS analytes under EPA Method 533 by the MDH-Laboratories Administration (MDH-LA). Samples collected under Phase 5 included raw and finished water samples. Raw water samples are untreated samples collected at wells with raw water taps. Finished water samples consist of treated water entering the distribution system. All samples were collected with corresponding field blanks. Multiple samples were routinely taken from systems with more than one source or treatment plant.

Figure 1: Phase 5 sampling locations of NTNC Water Systems. Each point represents an individual system. Several systems had more than one sample result associated with it.

May 2025

### **Results Overview**

Of the 441 NTNCs sampled, 19% (82 systems) had detection levels above the MCLs. Out of the 13 systems with detections above the PFAS Hazard Index, 11 of those systems also had detections above the PFOA and/or PFOS regulations.

Table 1 outlines the number of systems and samples with detections above the finalized regulations for the individual PFAS compounds. It should be noted that the number of systems and samples overlap between individual PFAS.

|   | PFOA  | PFOS  | PFNA  | PFHxS   | PFBS  | HFPO-DA<br>(GenX)                     | Hazard Index | Total |
|---|---|---|---|---|---|---------------------------------------|--------------|-------|

<u>Table 1:</u> Breakdown of results based on individual PFAS compounds with number of samples and number of systems.

Figure 2: Overview of Phase 5 Results. Each point represents an individual system. Several systems had more than one sample result associated with it.

Maryland can be split into two geological regions: the fractured rock region and the coastal plain region. These two regions are separated by the Fall Line, which runs roughly along Interstate 95 (I-95). The fractured rock region in Maryland is the area west of I-95, while the coastal plain region is east of I-95. Water system wells in the fractured rock region of the state are generally more susceptible to contamination than water system wells in the coastal plain region because of the lack of deep confined aquifer layers where water is drawn from. Confined aquifers have natural barriers, called confining layers, that prevent contamination from entering the water source. This is why the majority of the water systems that had sample results above the MCLs were in the fractured rock region (75 systems) versus the coastal plain region (7 systems). All systems sampled in the coastal plain region with results above the MCLs have one or more water sources in shallow unconfined aquifers.

Table 2 below gives a breakdown of the numbers of systems by county with detections above regulations. There are no NTNC systems on well water in Baltimore City; therefore, they were not included in Phase 5.

| County          | # of<br>Systems<br>Sampled | # of Systems<br>Above MCLs | Maximum<br>PFOS<br>Detected                 | Maximum<br>PFOA<br>Detected |
|-----------------|----------------------------|----------------------------|---|-----------------------------|

| Worcester       | 26                         | 0                          | 3.28  | 2.34                        |

**Table 2:** Breakdown of number of systems by county with detection above regulations. Maximum concentrations of PFOS and PFOA detected in each county are listed.

The results from Phase 5 were similar to results collected from CWSs under Phases 1 through 4. For the CWSs, 15% had MCL exceedances, compared with 19% for NTNCs. Exceedances for CWSs and NTNCs were primarily found in the fractured rock portion of the state and in withdrawals from unconfined aquifers in the coastal plain.

For water systems with PFAS detections above the MCLs, MDE has worked with them to develop and implement remediation plans. These actions included issuing public notices, performing additional

monitoring, and developing a plan to address the PFAS concentrations. Remedial actions that systems can take to address PFAS include installing treatment, interconnecting with a nearby system, removing a well from service, and finding an alternative water source (typically by drilling a new well).

MDE is actively coordinating with systems to connect them with funding through the Bipartisan Infrastructure Law to address elevated PFAS concentrations.
