NO$_x$ Ozone Season Emission Caps for Non-trading Large NO$_x$ Units

AQCAC Meeting – September 18, 2017
Topics Covered

• Background Information
  – Purpose of Regulations
  – Overview

• Maryland NOx Budget

• Regulatory Requirements

• Affected Sources

• Regulation Timeline
Purpose

- The purpose of this action is to propose new Regulations .01 - .04 under new Chapter COMAR 26.11.40 - NO\textsubscript{x} Ozone Season Emission Caps for Non-trading Large NO\textsubscript{x} Units to meet federal NO\textsubscript{x} (nitrogen oxides) SIP (State Implementation Plan) Call requirements under the Clean Air Act
• **NO\textsubscript{x} SIP Call – 1998**
  - All large sources of NO\textsubscript{x} required to report ozone season emission tonnage
  - EPA allocated each State a specific NO\textsubscript{x} ozone season emission budget cap
  - EPA classified large sources as either electric generating units (EGUs) or Non-EGU
  - Large sources of NO\textsubscript{x} were boilers and combustion turbines over 25 MW or 250 MMBTu/hr
• Clean Air Interstate Rule (CAIR) - 2009

• Cross State Air Pollution Rule (CSAPR) – 2015
  – EPA’s CAIR and CSAPR programs were developed to limit emissions from fossil fuel-fired EGUs that are part of the electricity grid and are > 25 MW (cap and trade programs)
  – Each affected State was tasked with preparing a plan to address the non-trading units – or boilers, combustion turbines or combined cycle units with a maximum design heat input greater than 250mmBtu/hr
Maryland NO\textsubscript{X} Budget

- NO\textsubscript{X} budget caps for Non-trading large NO\textsubscript{X} units (Non-EGUs) were established in Maryland’s SIP revision to comply with the NO\textsubscript{X} SIP Call
  - Set ozone season NO\textsubscript{X} budget at 1,013 tons

- In 2010, under COMAR 26.11.14.07, MDE allocated all of the budget to the only identified source in Maryland – Luke Paper Mill

- A recent review of existing and proposed sources in Maryland has shown that there are additional facilities that now have units that fall under the Non-trading large NO\textsubscript{X} unit requirements of the CAA
26.11.40 Requirements

- MDE needs to reallocate Maryland’s Non-trading large NO\textsubscript{\chi} unit ozone season NO\textsubscript{\chi} budget among the affected sources.

- Federal regulations also require “Part 75” continuous emission monitoring, reporting and record keeping for NO\textsubscript{\chi}. 
26.11.40 Requirements

• Each affected source will be required to limit their ozone season NO$_x$ emissions to meet or be under the NO$_x$ ozone season tonnage cap.

• NO$_x$ ozone season tonnage cap for each facility was calculated using permit conditions, regulatory emission rates and capacity factors.

• The New Unit Set Aside is the remaining tons available to any potential new source.

Affected Units

• Dominion Energy Cove Point LNG
  – Frame 5-1, Frame 5-2, Frame 7-A, Frame 7-B, Aux A and Aux B

• American Sugar Refining, Inc.
  – Unit No. C6

• Luke Paper Mill
  – Units No. 24, 25 and 26
Dominion Energy is constructing liquefaction facilities for exporting liquefied natural gas (LNG) at its existing Cove Point Terminal on the Chesapeake Bay in Lusby, Maryland. The proposed liquefaction facilities, combined with existing facilities, will provide a bi-directional service of import and export of LNG.
Dominion Energy Cove Point

- Operates new combustion turbines and auxiliary boilers which meet the applicability threshold of COMAR 26.11.40.
  - existing combustion sources not affected by this rule: smaller boilers, vaporizer's, water-ethylene glycol (WEG) heaters, emergency generators and fire pumps.

- All of the new combustion turbines at the facility are equipped with selective catalytic reduction (SCR) post-combustion NO$_X$ controls. SCR is one of the most effective ways of reducing NO$_X$ in a flue gas stream.

- New equipment coming on-line. Anticipate 2018 annual NOx = 500 tpy.
  - revised permit for expansion requires BACT and LAER for all emissions.

### Annual Facility NO$_X$ Emissions

American Sugar Refining, Inc.

- American Sugar Refining, Inc. (ASR) operates a sugar manufacturing plant in Baltimore, MD which produces granulated and confectioners sugars from raw cane sugar. The facility also manufactures bulk quantities of liquid cane sugars and syrups for industrial consumption.
American Sugar Refining, Inc.

- Operates a centralized steam and electrical cogeneration energy production facility (boiler house).

- There are four (4) boilers (130 million Btu/hr each) which fire natural gas and use #6 fuel oil in curtailment and testing situations.

- The affected boiler (Unit C6) is rated at 300 million Btu/hr and fires natural gas only.
  - Unit C6 converted to NG (from coal) in 2014.

- Permit condition limits facility-wide daily NO\textsubscript{X} emissions to 624 lbs/day and annual NO\textsubscript{X} emissions to 60 tons per year.

Luke Paper Mill

- Luke Paper Company in Luke, Maryland produces coated freesheet papers used for commercial and publication printing as well as coated one side papers for label applications.
Luke Paper Mill

- Operates three boilers that use a common stack for their emissions.
  - Already monitor and report NOx emissions per CFR Part 75.
  - Two recovery boilers and wood digester’s not affected by proposed regulation.

- Significant reductions achieved for Regional Haze
  - Unit 24 repowered from coal to natural gas as a primary fuel, use fuel oil as a secondary power source only when the natural gas supply is constrained, and apply BART emission rate \( \text{NO}_x \) @ 0.4 lbs/mmBtu).
  - Unit 25 coal/NG fired regulated under COMAR 26.11.14.07 (Ozone Season \( \text{NO}_x \) @ 0.7 lbs/mmBtu; non-OS \( \text{NO}_x \) @ 0.99 lbs/mmBtu)
  - Unit 26 NG fired regulated under COMAR 26.11.14.07

- Ozone Season NOx cap reduced from 947 tons to 656 tons.

National Institutes of Health

- The National Institutes of Health (NIH) is responsible for biomedical and public health research. It is part of the United States Department of Health and Human Services with facilities mainly located in Bethesda, Maryland.
In 2000, NIH installed a combined cycle system for the purpose of hot water and space heating generation. The combined cycle system is made up of a combustion turbine, boiler, and reheat unit.

Historically, the reheat unit of the combined cycle system (with supplemental heat input) has never operated during the ozone season. In fact the combined cycle system only operates minimally during the year. NIH has other space heater units available for heating purposes.

NIH planning to take a permit condition which precludes operating the unit as a combined cycle system (prohibit operation of the supplemental heat input) during the ozone season (May 1 - Sept 30).

Should NIH decide to maintain the flexibility to operate the combined cycle system during the ozone season, the emission caps and Part 75 monitoring requirements of this action shall apply.

NIH would require an ozone season emission cap of ~ 40 tons.
Timeline

- EPA begins NOx SIP Call discussions
  - August 31, 2016

- Discussion with affected sources begins
  - October 2016

- AQCAC Action Item
  - September 18, 2017

- Regulation Adoption
  - NPA – December 8, 2017
  - Public Hearing – January 8, 2018
  - NFA – February 2, 2018

- Effective Date
  - February 12, 2018

- Regulatory requirements
  - May 1, 2018
Discussion
